

RAPID[®]*P.aeruginosa* Agar for Water Testing

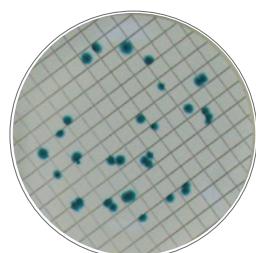

Reliable Monitoring of Bottled Water

- Easier than conventional methods
- Direct enumeration of *Pseudomonas aeruginosa* in 22–30 hours; no confirmation required
- High enzymatic specificity
- Highly contrasted and very specific colony color for quick and easy reading
- Results certified by NF VALIDATION — alternative method that is comparable to the NF EN ISO 16266 standard

RAPID[®]*P.aeruginosa* Agar
for Water Testing

Principle

RAPID'P.aeruginosa is a selective chromogenic culture medium for the direct enumeration (without confirmation) of *P. aeruginosa* using the membrane filtration method.

It is particularly suitable for the testing of water for human consumption, in particular bottled water and untreated water, such as water from wells, lakes, and streams, where the commensal water flora are abundant and for which the standard medium is nonspecific for *P. aeruginosa*.

The principle of RAPID'P.aeruginosa medium is based on the detection of an enzymatic activity typical of *P. aeruginosa*. Under the enzyme's action, a specific chromogenic substrate is cleaved, leading to the formation of a blue to blue-green precipitate on the *P. aeruginosa* colonies.

The selective mixture inhibits the majority of interfering flora, in particular, other species of *Pseudomonas*. Their colonies appear transparent or pigmented yellow and are easily distinguishable from those of *P. aeruginosa*.

Key Benefits

- High specificity for direct enumeration of *P. aeruginosa*
- Complete results in 22–30 hr
- Reliable results compared to the CN agar method
- Good colony color contrast for rapid assessment
- No confirmation step required

Ordering Information

Catalog #	Description
3563984	RAPID'P.aeruginosa Agar, ready to use, 55 mm x 20 dishes
3564900	RAPID'P.aeruginosa Agar, dehydrated, 500 g
