Section 1

Acrylamide and Bis-Acrylamide Calculations

Use these calculations to determine the volumes of stock acrylamide and bis-acrylamide solutions necessary to produce gels of any percent and volume. Refer to Section 2 for predetermined formulas for 37.5:1 (2.67% C) and 19:1 (5% C).

1.1 To determine monomer and crosslinker ratios

- 1) (A) is the part of total monomer that is acrylamide

$$A = \frac{\text{g acrylamide}}{\text{g acrylamide} + \text{g bis-acrylamide}}$$

- 2) (C) is the part of total monomer that is bis-acrylamide

$$C = \frac{\text{g bis-acrylamide}}{\text{g bis-acrylamide} + \text{g acrylamide}}$$

1.2 To determine the volume of 40% acrylamide stock solution

- 1) Calculate the value (A) for the desired gel percentage (gel%) using the equation in Section 1.1.

- 2) Plug values into the equation

$$\frac{(A)(\text{gel\%})(\text{Final vol})}{(40\% \text{ acrylamide solution})} = \text{ ml of } 40\% \text{ acrylamide}$$

1.3 To determine the volume of 2% bis-acrylamide stock solution

- 1) Calculate (C) for the desired gel percentage (gel%) from the equation in Section 1.1.
- 2) Plug values into equation:

$$\frac{(C)(\text{gel\%})(\text{Final vol})}{(2\% \text{ bis-acrylamide solution})} = \text{ ml of } 2\% \text{ bis-acrylamide}$$
