Choose the easy way for your auto-control monitoring of *Pseudomonas aeruginosa* in bottled water in less than 24 hours

- **Easier than conventional methods**
  Direct enumeration of *Pseudomonas aeruginosa* in 22-30 hours
  No confirmation required

- **High enzymatic specificity** delivering highly contrasted and very specific colony coloration for quick and easy reading

- **Validations**
  Certified NF VALIDATION as an alternative method to the NF EN ISO 16266 standard

### Principle

RAPID’P. aeruginosa is a selective chromogenic culture medium for the direct enumeration (without confirmation) of *Pseudomonas aeruginosa* using the membrane filtration method.

It is particularly suitable for the testing of water for human consumption, in particular bottled water and untreated water such as water from wells, lakes and streams wherein the commensal water flora is abundant and for which the standardized medium is non-specific for *P. aeruginosa*.

The principle of RAPID’P. aeruginosa medium is based on the detection of an enzymatic activity typical of *P. aeruginosa*. Under its action, a specific chromogenic substrate is cleaved leading to the formation of a blue to blue-green precipitate on the *Pseudomonas aeruginosa* colonies.

The selective mixture makes it possible to inhibit the majority of interfering flora, very important in water, in particular *Pseudomonas* non-aeruginosa. Other microorganisms may however show growth. Their colonies appear transparent or pigmented yellow-green and are easily distinguishable from those of *Pseudomonas aeruginosa*.

### Key Benefits

- High specificity for a direct enumeration of *Pseudomonas aeruginosa*
- Complete results within 22-30 hrs
- Reliable results compared to the CN Agar method
- Good colony coloration contrast for rapid assessment
- No confirmation step required

**Water sample filtration**

**Membrane**

**22-30 hrs**

**36°C**

**RAPID’P.aeruginosa**

- Detection and enumeration of *Pseudomonas aeruginosa*
- Certified NF VALIDATION as an alternate method according to the NF EN ISO 16266 standard
- Membrane water sample filtration
- Enumeration of typical colonies
  - Blue to blue-green colonies

**High specificity for a direct enumeration of *Pseudomonas aeruginosa***

**Complete results within 22-30 hrs**

**Reliable results compared to the CN Agar method**

**Good colony coloration contrast for rapid assessment**

**No confirmation step required**
