## **Gene Information**

| Gene Name            | polymerase (RNA) I polypeptide B, 128kDa                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gene Symbol          | POLR1B                                                                                                                                                                                                                                                                                                                                                                                                               |
| Organism             | Human                                                                                                                                                                                                                                                                                                                                                                                                                |
| Gene Summary         | Eukaryotic RNA polymerase I (pol I) is responsible for the transcription of ribosomal RNA (rRNA) genes and production of rRNA the primary component of ribosomes. Pol I is a multisubunit enzyme composed of 6 to 14 polypeptides depending on the species. Most of the mass of the pol I complex derives from the 2 largest subunits Rpa1 and Rpa2 in yeast. POLR1B is homologous to Rpa2 (Seither and Grummt 1996) |
| Gene Aliases         | FLJ10816, FLJ21921, MGC131780, RPA135, RPA2, Rpo1-2                                                                                                                                                                                                                                                                                                                                                                  |
| RefSeq Accession No. | NC_000002.11, NT_022135.16                                                                                                                                                                                                                                                                                                                                                                                           |

## Validation Results

| Efficiency (%)    | 104    |
|-------------------|--------|
| R <sup>2</sup>    | 0.9989 |
| cDNA Cq           | 20.12  |
| cDNA Tm (Celsius) | 80.5   |

| gDNA Cq         | 37.4 |
|-----------------|------|
| Specificity (%) | 100  |

Information to assist with data interpretation is provided at the end of this report.

## POLR1B, Human

#### **Amplification Plot**

Amplification of cDNA generated from 25 ng of universal reference RNA

#### **Melt Peak**

Melt curve analysis of above amplification

#### **Standard Curve**

Standard curve generated using 20 million copies of template diluted 10-fold to 20 copies

## Products used to generate validation data

| Real-Time PCR Instrument      | CFX384 Real-Time PCR Detection System            |
|-------------------------------|--------------------------------------------------|
| Reverse Transcription Reagent | iScript™ Advanced cDNA Synthesis Kit for RT-qPCR |
| Real-Time PCR Supermix        | SsoAdvanced™ SYBR® Green Supermix                |
| Experimental Sample           | qPCR Human Reference Total RNA                   |

### Data Interpretation

| Unique Assay ID               | This is a unique identifier that can be used to identify the assay in the literature and online.                                                                                                                                                                                                                                                                                                  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Detected Coding Transcript(s) | This is a list of the Ensembl transcript ID(s) that this assay will detect. Details for each transcript can be found on the Ensembl website at www.ensembl.org.                                                                                                                                                                                                                                   |
| Amplicon Context Sequence     | This is the amplicon sequence with additional base pairs added to the beginning and/or end of the sequence. This is in accordance with the minimum information for the publication of real-time quantitative PCR experiments (MIQE) guidelines. For details, please refer to the following publication, "Primer Sequence Disclosure: A Clarification of the MIQE Guidelines" (Bustin et al 2011). |
| Chromosome Location           | This is the chromosomal location of the amplicon context sequence within the genome.                                                                                                                                                                                                                                                                                                              |
| Assay Design                  | Exonic: Primers sit within the same exon in the mRNA transcript and can potentially co-amplify genomic DNA. If performing gene expression analysis, it is suggested that the samples be treated with a DNase to eliminate potential unwanted signal from contaminating genomic DNA.                                                                                                               |
|                               | Exon-exon junction: One primer sits on an exon-exon junction in mRNA. When performing gene expression analysis, this design approach will prevent unwanted signal from contaminating genomic DNA.                                                                                                                                                                                                 |
|                               | Intron-spanning: Primers sit within different exons while spanning a large intron in the mRNA (intron is greater than 750bp). When performing gene expression analysis, this design approach should limit potential unwanted signal from contaminating genomic DNA.                                                                                                                               |
|                               | Small intron-spanning: Primers sit within different exons with a short intron in between (intron is smaller than 750bp). Small introns may not prevent unwanted signal from contaminating genomic DNA.                                                                                                                                                                                            |
| Efficiency                    | Assay efficiency was determined using a seven-point standard curve from 20 copies to 20 million copies. While an efficiency of 100% represents a perfect doubling of template at every cycle and is ideal, typical ranges of good assay efficiency are between 90-110%. For difficult targets, assay efficiency outside of this range are accepted and reported accordingly.                      |
| R <sup>2</sup>                | The R <sup>2</sup> represents the linearity of the standard curve and how well the standard curve data points fit the linear regression line. Acceptable values are >0.98.                                                                                                                                                                                                                        |

| cDNA Cq     | Cq value obtained from 25ng of cDNA transcribed from universal RNA when performing wet-lab validation of the assay.                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | Note: Not all genes will be expressed at a detectable level in the universal RNA sample.                                                                                                                                                                                                                                      |
| cDNA Tm     | Melting temperature of the amplicon when running a melt curve analysis.                                                                                                                                                                                                                                                       |
| gDNA Cq     | Cq value obtained when running the assay with 2.5ng of genomic DNA. This is more than a moderate level of genomic DNA contamination. Intron-spanning and exon-exon junction assay designs can minimize or eliminate genomic DNA detection.  Note: Genomic DNA contamination is often present at variable levels. If concerned |
|             | about genomic DNA contamination, the genomic DNA contamination control assay is recommended to run with your sample to determine if genomic DNA levels are sufficient to negatively impact results.                                                                                                                           |
| Specificity | This value is the percent of specific amplicon reads as measured by next generation sequencing (NGS). While 100% specificity is desirable, small decreases in specificity (<1%) can be due to NGS read errors. More significant reductions are likely due to co-amplification of homologous regions.                          |
|             | Note: Since gene expression can be cell type and condition specific, the exact level and impact of co-amplification in a given sample is impossible to predict. If co-amplification is detected, it should be taken into consideration and reported when analyzing gene expression results.                                   |
