Chapter 1 About QX ONE Software

QX ONE Software, as part of your QX ONE Droplet Digital PCR System, provides all necessary functionality to create, run, and analyze ddPCR experiments on your samples.

Note: In the QX ONE guides, you are instructed to tap options on the touchscreen. If you are using QX ONE Software with a keyboard and mouse, click the options instead. If QX ONE Software goes into standby mode after being idle, tap in the lockout screen to sign into the software again and redisplay the last active window.

The following image highlights functional areas:

![Functional Areas Diagram]

**Legend**

1. The status bar displays information about the instrument and user.
2. Tabs provide access to the main functional windows.
3. The main pane displays the details of the selected tab.

**Important**: The Regulatory Edition provides additional features to permit operation in compliance with Title 21 of the U.S. Code of Federal Regulations Part 11 (21 CFR Part 11) within a closed...
system. A closed system is defined as “an environment in which system access is controlled by
the persons who are responsible for the content of electronic records that are on the system"
(Section 11.3(b) (4)).

- The security controls built into the Regulatory Edition must be properly configured and
  administered by the software administrators in your organization in order to be secure and in
  compliance with 21 CFR Part 11.

- Bio-Rad makes no claim that the Regulatory Edition is CFR-compliant in and of itself, nor does
  the company guarantee compliance for the user. Your organization must establish policies and
  standard operating procedures that work in conjunction with the tools provided by Bio-Rad to
  ensure compliance with 21 CFR Part 11.

- The Regulatory Edition prompts you to log in again before executing an auditable action.

A Bio-Rad service engineer sets up your QX ONE Droplet Digital PCR System instrument and installs
QX ONE Software onto the touch screen computer. Your installation includes activation of a primary
superuser account, to be used by a system administrator in your organization. The superuser is
responsible for setting up additional users and assigning user privileges as required for regulatory
compliance. For information, see Managing Users on page 151.

Note: If you will be installing the software on additional computers to use for ddPCR file analysis,
see Appendix B, Additional Computers.

Using the instrument and software, you can

- Set up customized ddPCR experiments for plate runs in the QX ONE Droplet Digital PCR System
- Create and store plate, thermal cycling protocol, and report templates
- Use the live analysis function during the droplet reading phase
- Analyze your data files in a variety of charts and tables in the Analysis module
- Generate reports on your data
- Produce system and experiment audit logs to ensure clear adit trails for activities and
  consumable/reagent use through the Event Log, Data Archive, and automatic Lot Management
  functions (Regulatory Edition only)
- Safeguard user access with secure logins, traceable user activity, and session time-out settings
- Restrict template access to ensure the use of approved templates only

Note: When you open QX ONE Software on the touch screen, the Add Plate window appears by
default. If you open the software from a standalone computer, the Data Analysis window appears
by default and the Add Plate and Run Status tabs are not available.
Chapter 2 Getting Started in QX ONE Software

Use the information in this chapter to

- Sign into the software or change users
- Understand your assigned user privileges and modify your personal preferences
- Become familiar with the functional windows
- Learn the differences between the software installed on the instrument touch screen versus a standalone computer
- Understand the compatible file types for your software edition

Signing Into the Software

Your system administrator sets up users and privileges for the instrument and software, and communicates the information to you.

**Important:** In the Regulatory Edition, you are prompted to sign in again before the software can execute an auditable action.

**To sign in**

1. Tap the QX ONE Droplet Digital PCR System touch screen to open the Sign in dialog box.
The Sign in dialog box opens.

2. Enter your user name.

3. If the Sign in to: label shows the correct domain name, enter only the user name. If the label is blank or shows a different domain then enter it as domain name\user name

   **Note:** The domain and computer names shown in the graphics are examples only. If you are unsure of the domain name, contact your system administrator.

4. Enter the password, and then tap Sign in.
   
   On first use, you must agree to the end user license agreement.

5. Clear the Show EULA on sign in checkbox, and then tap I Agree.

   **Note:** If you tap I Disagree, the application closes immediately. If you leave the checkbox selected, you must agree to the EULA each time you log into the application.

   When you agree to the EULA, the dialog box closes and the application opens. Your user name appears in the Instrument Status bar.

   If you are opening the software on a standalone computer, the Data Analysis window opens.
Viewing Your User Privileges

In the User Setup and Preferences window, your privileges are identified by a green check mark in the corresponding checkbox.

➤ Select the User Setup and Preferences tab.

You can view your assigned privileges at any time, but the check boxes in the display are not enabled unless you are assigned the Add/Manage Users privilege.

Note: Users who are assigned the Add/Manage Users privilege can also create users and update privileges and preferences for any user. Only the superuser can remove the Add/Manage user privilege from a user account.
Table 1 lists the available privileges, which can be assigned in any combination.

**Table 1. User privileges**

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add and manage users</td>
<td>Add or remove users, set privileges, and change preferences.</td>

<tr>
<td>Data archive</td>
<td>Move raw data from the touch screen computer to free up disk space needed for runs on the instrument.</td>
</tr>
<tr>
<td>Access the Module Recovery Tool</td>
<td>For manual plate recovery, users can specify the processes to be rerun.</td>
</tr>
</tbody>
</table>
Managing Your Preferences

Use the User Setup and Preferences window to modify your personal user preferences.

Default folder locations appear in your preferences, but you can change the storage locations for your templates and data files. You can also choose to keep all your data files and templates private. The software prompts you to choose either your personal folder or the shared folder each time you save a file or template.

**Important:** If your system administrator enables the Preferred Locations in System Settings, data file folder locations in User Preferences are overridden, and all data files are saved to the preferred file paths. Users can still choose where to store templates.

**To modify your preferences**

1. Tap the User Setup and Preferences tab.
2. Change any of the following preferences:
   - Enter a different file path for your data files and templates.
   - Select or clear the check boxes to change your data file and template privacy settings.
     
     **Note:** The paths and checkboxes are disabled if your administrator has set preferred locations in System Settings.
   - Enter a different system timeout period.
   - Enter a different total of completed plates to show in the Run Status window, up to a maximum of 100.
3. Tap Save.
4. When the confirmation message appears, tap Yes to save the changes, and then tap OK.
Signing Out or Changing Users

While the software is running, one user can sign out and a different user can sign in.

**Note:** Where the screen is locked and the initial user left unsaved changes, an advisory prompt appears. The subsequent user has the option to save or discard the changes before completing the sign-out process.

**To sign out**
1. Tap the user name link in the upper-right corner and select Sign Out.
2. Tap Yes to confirm.
   - If there are unsaved changes, QX ONE Software displays a prompt.
     - To discard the changes and proceed, tap Yes.
     - To cancel the sign out, tap No. Save the changes, and then repeat Steps 1 and 2.

**To change users**
1. Tap anywhere in the lockout screen to display the Sign in window.
2. Enter a user name.
   - The domain name appears below the user login fields. If you are on the same domain as the previous user, you can enter your user name only.
   - If the user is on a different domain, enter the domain name followed by a backslash and the user name.
     
     `<domain name>\<user name>` *(for example, global\john_smith)*
   3. Enter the password and tap Sign in.
**Functional Windows**

This section briefly describes the functional areas in QX ONE Software. Table 2 explains the primary window accessed from each tab.

**Table 2. Window Tabs**

<table>
<thead>
<tr>
<th>Tab</th>
<th>Name</th>
<th>Purpose</th>

<tr>
<td>Help</td>
<td>Access software version information, the End User License Agreement, the Bio-Rad website, open source software license information, and this document in PDF format.</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 2 Getting Started in QX ONE Software

Instrument Status Bar

An instrument status bar appears above all windows except the analysis displays, which open in a separate module.

The status bar on the touch screen displays the information and indicators shown below:

<table>
<thead>
<tr>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Software name and version</td>
</tr>
<tr>
<td>2</td>
<td>Instrument name and status information</td>
</tr>
<tr>
<td>3</td>
<td>Number of runs in progress and runs available</td>
</tr>
<tr>

<td>Oil and waste levels</td>
</tr>
<tr>
<td>5</td>
<td>Open or close the Inbox or Outbox</td>
</tr>
<tr>
<td>6</td>
<td>Used and free disk space in gigabytes (GB)</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: When QX ONE Software detects low disk space, the software displays an advisory prompt to archive data.</td>
</tr>
<tr>
<td>7</td>
<td>Name of the current user, along with the current date and time</td>
</tr>
<tr>
<td>8</td>
<td>Closes the QX ONE Software application</td>
</tr>
</tbody>
</table>

LEGEND

1. Software name and version
2. Instrument name and status information
3. Number of runs in progress and runs available
4. Oil and waste levels
5. Open or close the Inbox or Outbox
6. Used and free disk space in gigabytes (GB)
   **Note**: When QX ONE Software detects low disk space, the software displays an advisory prompt to archive data.
7. Name of the current user, along with the current date and time
8. Closes the QX ONE Software application
Add Plate Window

On the QX ONE Droplet Digital PCR System touch screen, QX ONE Software opens to the Add Plate window, where you can set up a plate for an experiment and start a ddPCR run. You can also recover a plate that experienced a failure during the run. For information, refer to the QX ONE Droplet Digital PCR System and QX ONE Software User Guide.

Note: If you are using the software on a computer other than the touch screen, the Add Plate window is not accessible and QX ONE Software displays the Data Analysis window by default.

From the Add Plate window you can

- Add plates in the software
- Recover a plate from a failed run
- Access the Plate and Protocol Configuration window to configure your plates and PCR protocols
- Run experiments on your plates and protocols

QX ONE Software enables each button sequentially (Add Plate, Configure Plate, Start Run) when you complete the prerequisite tasks. If the QX ONE Droplet Digital PCR System experienced a failure during the run, the Recover Plate button is enabled. For more information on adding and recovering plates, refer to the QX ONE Droplet Digital PCR System and QX ONE Software Instrument Guide.
Chapter 2 Getting Started in QX ONE Software

Run Status Window

You can view the Run Status window on the QX ONE Droplet Digital PCR System touch screen.

**Note:** If you are using the software on a computer other than the touch screen, the Run Status window is not available.

The Run Status window displays information on:

- The runs in process in the top pane
- Up to 100 completed runs for the current user in the bottom pane, including plate failures and recoveries

  **Note:** You set the number of completed runs to show in your user preferences. For information, see [Managing Your Preferences on page 13](#).

For more information, refer to the QX ONE Droplet Digital PCR System and QX ONE Software Instrument Guide.

![Run Status Window](image-url)
Data Analysis Window

The Data Analysis window displays a list of analysis files created at the end of each run.

![Image of Data Analysis Window]

From the left panel, you can select files from the following storage areas to open in the Data Analysis module:

- **Recent Datafiles**
  
  A list of files that you have opened.

- **My Datafiles or System Datafiles**
  
  If the system administrator has
  
  - Not set shared locations in System Settings, all data files are automatically saved to the file path specified in the user’s preferences.
  
  - Set shared locations in System Settings, all data files are automatically saved to the path specified for Datafile Storage Location. Preferred locations override individual user preferences.

  **Important:** For either choice, the specified path must be a local folder on the QX ONE Droplet Digital PCR System touch screen computer.

  **Note:** For information on files types you can open and save, see **Compatible File Types on page 25**.

- From the right panel, you can access the Gene Study module. For information on Gene Studies, see **Gene Study Module on page 125**.
Template Setup Window

The Template Setup window allows you to

- Create new plate, thermal cycling protocol, and report templates
- Search for existing templates
- Modify existing templates

If you are assigned the Create New Template user privilege, you can save new or modified templates for reuse. You can save templates to a personal or system folder (My Templates or System Templates, respectively), or you can save them to the Shared Templates location.

**Note:** If your system administrator has specified Preferred Locations in the System Settings window, the System Templates location overrides the folder specified in your user preferences. However, you have the option to save the template to the shared file location instead.

For information on creating or editing templates, see

- Creating or Editing Plate Templates on page 27
- Creating or Editing Thermal Cycling Protocol Templates on page 43
- Creating Report Templates on page 119
System Status Window

The System Status window displays information about your QX ONE Droplet Digital PCR System and QX ONE Software.

Depending on your permission level, you can

- View or change shared storage folder locations
  
  **Important**: System administrators can override individual storage locations and set preferred locations for data files and templates. Only administrators can establish or change these locations.

- View event and maintenance logs, and maintenance reports

- Archive raw data

**Note**: The Instrument Calibration tab is enabled only for the Bio-Rad service engineer user account.
User Setup and Preferences Window

The User Setup and Preferences window displays the privileges that a software administrator, if assigned the Add/Manage Users privilege, can assign to each user, and personal preferences that can be set or modified by users and administrators.

**Note**: Users who are not assigned any of the privileges listed can still execute runs and use the Analysis module.

For information on user privileges, see Viewing Your User Privileges on page 11 and for information on user preferences, see Managing Your Preferences on page 13.
Help Window

The Help window provides links to important information about QX ONE Software and Bio-Rad Laboratories, Inc.

Select the Help tab to display links to

- Software and firmware version information
- End user license agreement (EULA)
- Bio-Rad website
- Open-source software license information
- QX ONE Software User Guide (this document)
**Touch Screen Differences**

As shown in Table 3, QX ONE Software functionality varies between the QX ONE Droplet Digital PCR System touch screen and a standalone computer.

**Table 3. Touch Screen Differences**

<table>
<thead>
<tr>

<td>Disabled</td>
</tr>
</tbody>
</table>
Compatible File Types

This section describes the file types you can open in QX ONE Software.

The following applies if your organization is using more than one edition of the software:

Table 4. Compatible software file types

<table>
<thead>
<tr>
<th>File Type</th>
<th>Extension</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plate</td>
<td>.ddplt</td>
<td>Plate template file containing setup details to perform experiments; this file type opens in the Plate Editor.</td>
</tr>
<tr>
<td>Protocol</td>
<td>.ddthp</td>
<td>Protocol template file containing setup details to perform experiments; this file type opens in the Protocol Editor.</td>
</tr>
<tr>
<td>Data</td>
<td>.ddpcrsone</td>
<td>Contains the results of an experiment run and data analysis performed in QX ONE Software Regulatory Edition; this file type opens in the Analysis module.</td>
</tr>
<tr>
<td>Data</td>
<td>.ddpcrs</td>
<td></td>
</tr>
<tr>
<td>Data</td>
<td>.qlps</td>
<td>File type from older QuantaSoft regulatory versions, for two-channel experiment runs and data analysis; this file type opens in the Analysis module.</td>
</tr>
</tbody>
</table>

**Note:** You can open a .ddpcrs file in the QX ONE Software Analysis module, but the file is saved as a .ddpcrsone file.

**Note:** You can open .qlps files in QX ONE Software Regulatory Edition, but if you make any changes, the software prompts you to save the file as a ddpcrsone file.
Chapter 3 Creating or Editing Plate Templates

If you are assigned the Create New Templates user privilege, you can save a new or reconfigured plate as a template for reuse from the Add Plate and Template Setup windows.

Templates that are available to you appear in the default view of the Template Setup tab, as follows:

- Templates you created and saved, which are saved to one of the following paths:
  - The path specified in your user preferences; these appear under My Templates
  - The path specified under Preferred Locations in System Settings, if your system administrator has specified the path for all users, these appear under System Templates
    - Important: If your administrator has specified the Preferred Location for all users, the path overrides the path specified in user preferences. Preferred locations can be enabled only by users with the System Settings user privilege.
- Templates created and saved by any user and designated as shared; these appear under Shared Templates.
Plate Editor Window

Use the Template Setup Plate Editor to

- Create new or edit existing plate template files
- Save new or modified templates for reuse (with Create New Templates permission only)
- Define or change experiment type, sample type, supermix, and assay type for each well
  
  **Tip:** Except for the supermix, which you must select pre-run, you can configure the plate experiment parameters before, during, or after a run.

- Set reference targets and control samples
- Exclude wells from droplet generation and droplet reading, or just droplet reading
- Add applicable plate or well notes

The Plate Layout view is the default template view.

---

**LEGEND**

1. You can access the Edit and Exclude buttons from the top of the screen.
2. The right pane contains the interface for defining your experiment parameters.
The left pane displays the plate grid and configuration information in each well.

The Well Data button toggles to the Well Data table, where you can see your plate setup in a tabular format, and then back to the Plate Editor. When the Well Data table is displayed, the button name changes to Plate Layout.

Legend, continued

Plate Editor Tools

Use the buttons described in Table 5 to define your experiment in the Plate Template Editor.

Experiment Types

QX ONE Software offers seven experiment types from which you can choose, each enabling different assay options and analysis tools. Table 6 briefly explains each experiment type.

Tip: You can assign multiple experiment types within the plate, but you can assign only one experiment type to each well.

Table 6. Experiment types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct quantification (DQ)</td>
<td>DQ uses absolute quantification to determine the concentration (copies/μl) of target DNA copies in a sample. DQ measures the number of positive and negative droplets for each target in a well based on their fluorescence amplitude, and uses a Poisson algorithm to calculate the starting concentration of each target DNA molecule. <strong>Note:</strong> The ABS experiment type created in QuantaSoft Software versions 1.4 through 1.7 is automatically mapped into the software as a DQ experiment type.</td>
</tr>
<tr>
<td>Copy number variation (CNV)</td>
<td>CNV determines concentration (as with DQ) and calculates the copy number of an unknown (CNV) target relative to a known reference or references within the same well.</td>
</tr>
<tr>
<td>Mutation detection (MUT)</td>
<td>MUT determines concentration (as with DQ) and calculates the fractional abundance of an unknown mutant present at a low frequency in a wild-type background.</td>
</tr>
<tr>
<td>Rare event detection (RED)</td>
<td>RED determines the concentration of a known mutant or a rare target species relative to a given reference species within a large pool of background DNA.</td>
</tr>
<tr>
<td>Drop-off (DOF)</td>
<td>DOF determines absolute quantification of targets for assays designed to detect non-wild type sequences, such as indels and genome edits; DOF is designed to support an assay strategy where one probe counts all alleles and one “drop-off” probe sits on top of a predicted cut site.</td>
</tr>
<tr>
<td>Gene expression (GEX)</td>
<td>GEX determines concentration (as with DQ) and calculates relative expression levels of an unknown target relative to a known reference or references within the same well.</td>
</tr>
<tr>
<td>Residual DNA quantification (RDQ)</td>
<td>RDQ provides a precise method for residual host cell DNA quantification. <strong>Note:</strong> Users can enter a conversion factor to calculate the mass for a well, up to three decimals. The software displays the result in the Molecular Weight column of the Data Table.</td>
</tr>
</tbody>
</table>
Sample Descriptions

QX ONE Software allows you to enter descriptive words or phrases for your sample in up to four fields per well. Descriptors can include information such as research type, dilution factors, and so forth.

Tip: Only the information from the first field appears in the Plate Editor layout. However, you can see entries in the second, third, and fourth fields in the Well Data table, or you can pause on a well to display a tool tip, as shown in the following graphic.

Sample Types

QX ONE Software offers four sample types:

- Unknown
- NTC (no template control)
- Positive control, where one or more targets are expected
- Negative control, where no response is expected

Tip: You can assign multiple sample types within the plate, but you can assign only one sample type to each well.
Supermixes

Important: Use of unapproved supermixes can harm the instrument and void the warranty.

QX ONE Software offers five PCR supermixes. Each supermix is optimized to deliver maximum PCR efficiency and sensitivity for the amplification and detection of DNA and RNA targets.

- **ddPCR Multiplex Supermix** — For use in nucleic acid sample preparations to amplify and detect DNA targets in probe-based experiments involving multiple targets

  **Note:** Bio-Rad recommends using ddPCR Multiplex Supermix for Cy5 and Cy5.5 probes assays.

- **ddPCR Supermix for Probes (No dUTP)** — For use in nucleic acid sample preparations, with sensitivity for the amplification and detection of DNA targets using hydrolysis probe-based assays

- **ddPCR Supermix for Probes** — For use in sample preparation with uracil N-glucosylase (UNG) decontamination protocols to prevent the reamplification of carryover PCR products between experiments

- **ddPCR Supermix for Residual DNA Quantification** — For use in residual DNA detection

- **One-Step RT ddPCR Advanced Kit for Probes** — For use in absolute quantification of target RNA molecules
Assay Types and Fluorophores

QX ONE Software offers a total of five assay methods, which are explained in Table 7.

Table 7. Assay types

<table>
<thead>
<tr>
<th>Assay type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single target per channel</td>
<td>Method assuming up to four probe colors (FAM, HEX/VIC, Cy5 and Cy5.5) and up to four targets per well, with a single target detected per channel. This is the default assay type, with the maximum four rows displayed. You can delete up to three rows. This assay type is available for the DQ, CNV, MUT, RDQ, RED, and GEX experiment types.</td>
</tr>
<tr>
<td>Amplitude multiplex</td>
<td>Method to increase multiplexing up to eight targets per well, with one or two targets detected per channel. The maximum of eight rows are displayed. You can delete up to seven rows.</td>
</tr>
<tr>
<td>Probe mix triplex</td>
<td>Triplex mode that allows two groups of three targets each. Group 1 has 1 target in FAM, 1 target in HEX/VIC, and 1 target in both channels. Group 2 has 1 target in Cy5, 1 target in Cy5.5, and 1 target in both. You can delete a group, but not the individual targets within the group. <strong>Note</strong>: The channels within each group are not interchangeable therefore FAM is always paired with HEX/VIC and Cy5 with Cy5.5.</td>
</tr>
<tr>
<td>Advanced classification</td>
<td>Method to increase multiplexing rate up to 10 targets per well in any combination of method targets detected per channel. This method requires manual classification of droplets. This assay type is available for the DQ and RED experiment types.</td>
</tr>
<tr>
<td>Basic drop-off</td>
<td>This mode allows two groups of two targets each. Group 1 is shown by default, with one target in FAM and HEX/VIC and one target in FAM or HEX/VIC. This assay type is available only for the DOF experiment type. You can add one more group of two targets, with one target in Cy5 and Cy5.5, one target in Cy5 or Cy5.5. You can delete a group, but not the individual targets in the group. <strong>Note</strong>: The channels within each group are not interchangeable therefore FAM is always paired with HEX/VIC and Cy5 with Cy5.5.</td>
</tr>
</tbody>
</table>
The experiment type you select determines the available assay methods. Table 8 displays the sample type associated with each assay method.

**Table 8. Assay types by experiment type**

</table>
Opening a New Plate Template

You can open a blank plate template from either the Template Setup window or the Add Plate window.

- Use Template Setup if you are creating one or more templates to store for future use.
- Use Add Plate if you are creating a template to correspond to a plate you are about to run.

To open a new plate template from the Template Setup window

1. Tap the Template Setup tab.
2. Tap Plate Setup.
3. Tap Add New Plate.
4. Tap Edit Plate Layout.
   The Plate Editor opens, displaying a blank plate template.
5. To set up your plate, see Template Setup — Setting Up Your Wells on page 37.

To open a new plate template from the Add Plate window

1. Tap the Add Plate tab.
2. Tap the + icon next to Add Plate and follow the prompts to insert a plate into the instrument.
3. When the software enables the Configure Plate button, tap Configure Plate.
   The Plate Configuration window opens to the Plate Information tab by default.
4. Under Plate Template, tap Create New.
   The template Plate Editor opens, displaying a blank plate layout.
5. To set up your plate, continue to Template Setup — Setting Up Your Wells on page 37.
Chapter 3 Creating or Editing Plate Templates

Opening an Existing Plate Template

You can open an existing plate template from either the Template Setup window or the Add Plate window.

- Use Template Setup if you are editing one or more templates to store for future use.
- Use Add Plate if you are editing a template to correspond to a plate you are about to run.

**To open an existing plate file from the Template Setup window**

1. Tap the Template Setup tab.

   ![Template Setup Tab]

   The Plate Setup window appears by default and a list of available plate templates appears.

2. Select a template and tap Edit Plate Layout.

   **Tip:** You can also double-click the template file to open it.

   The Plate Editor opens, displaying the plate template as it is currently configured.

   To make changes to the plate, continue to Template Setup — Setting Up Your Wells on page 37.

**To open an existing plate template from the Add Plate window**

1. Tap the Add Plate tab.

   ![Add Plate Tab]

2. Tap the + icon next to Add Plate and follow the prompts to insert a plate into the instrument.

3. When the software enables the Configure Plate button, tap Configure Plate.

   The Plate Configuration window opens to the Plate Information tab by default.

4. Under Plate Template, tap the dropdown arrow and select a template from the list.

   The template Plate Editor opens, displaying the configured layout.

   You can run the plate without changing the template, or you can modify the configuration. To make changes to the plate, continue to Template Setup — Setting Up Your Wells on page 37.
Template Setup — Setting Up Your Wells

When you open the Plate Editor from the Template Setup tab, the Edit button is selected by default. You can assign different experiment parameters to each well or groups of wells.

For each well, or group of wells, you must

- Choose an experiment type
- Select a sample type
- Select a supermix
- Select an assay method

Optionally, you can

- Enter up to four sample descriptors for each well
- Modify fluorophore assignments
- Add notes for each well
- Add notes for the plate

If you are creating a new template, the grid is blank. If you are editing an existing template, previously saved information appears when you select one or more configured wells.
To define well parameters

1. Select a well or group of wells.

2. From the Experiment Type dropdown list, select a new or different experiment type. For more information, see Experiment Types on page 30.

3. In the Sample Description fields, enter or change up to four words or phrases that describe the sample. For more information, see Sample Descriptions on page 31.

4. From the Sample Type dropdown list, select a new or different sample type. For more information, see Sample Types on page 31.

5. From the Supermix dropdown list, select or change the supermix. For more information, see Supermixes on page 32.

6. The Assay Type field populates automatically based on your experiment selection. To change it, select a different assay type from the dropdown list. For information, see the fluorophore options in Assay Types and Fluorophores on page 33.

   Note: Available assay types vary, depending on the selected experiment type.

7. (Optional) Under Target Info, change the fluorophore assigned to a channel.

   The fluorophore information populates automatically for each target, with the maximum number of rows allowed for the assay method, but you can modify the default fluorophore assignments, if applicable.

   a. Tap the field dropdown arrow and select an alternative.

   b. To delete a row, tap the minus (-) icon next to the target.

   c. To re-add a row, tap the plus (+) icon.

8. (Optional) To clear one or more wells at any time, select the wells and tap Clear Selected Wells.

9. Tap Apply.

   Note: You must tap Apply for the software to recognize your new or edited information, and before you can save the template. Once applied, you can pause on a well to see the corresponding information in a tool tip.
10. Exclude wells in the plate from droplet generation and droplet reading, or from droplet reading only. For information, see Template Setup – Excluding Wells.

   **Important:** The QX ONE Droplet Digital PCR System processes all 96 wells in the plate by default. If you have filled fewer than 96 wells with sample or buffer, you should exclude the remainder.

11. If you are finished with your plate configuration, tap Save in the upper-right corner and then in the Save dialog box, enter a new name for the template and tap Save again.

   **Note:** You must save the template with a new name. You cannot overwrite existing templates. If you tap the Save button before the plate layout is complete, the file closes and you must reopen it from the saved template location.

**Template Setup – Excluding Wells**

Optionally, you can exclude wells from the droplet digital PCR run.

**Important:** The QX ONE Droplet Digital PCR System processes the entire 96-well plate by default. If you have added your sample to fewer than 96 wells in the plate, you must exclude the remainder.

The GCR96 cartridges that are inserted into the instrument contain six separate sections, each with two rows of eight wells each. The QX ONE Droplet Digital PCR System automatically generates droplets by section rather than by well or by individual column. In the QX ONE Software well exclusion design, the first two columns represent the first section, the second two columns the second section, and so forth.

When you select Droplet Generation and Droplet Reading, the software allows you to exclude each section from both processes, but if you try to exclude an odd number of columns, QX ONE Software automatically selects the remaining column.

When you select Droplet Reading, the software allows you to exclude any well or group of wells from the droplet reading phase.
Wells excluded from droplet generation and droplet reading are displayed with a criss-cross pattern.

Wells excluded from droplet reading are identified by a diagonal pattern.

**To exclude columns from droplet generation and droplet reading**

1. Select one or more column pairs to exclude, and then tap Droplet Generation and Droplet Reading.

   ![Diagram of droplet generation and exclusion](image)

   **Note:** If you selected an odd number of columns, the software automatically selects the remaining column to represent a section. You can exclude that column from droplet reading only.

2. Tap Exclude Selected Wells.
To exclude wells from droplet reading

1. Select one or more wells to exclude, either individually or in groups, and then tap Droplet Reading.
   
   **Tip:** To exclude multiple wells, press the CTRL key, and then select the wells to exclude.

2. Tap Exclude Selected Wells.

**Note:** The Exclude Selected Wells button is a toggle button. If you select wells that have been excluded, the button name changes to Include Selected Wells. If you excluded one or more wells that should be read, you can select the wells and then tap the button to include them.
Chapter 4 Creating or Editing Thermal Cycling Protocol Templates

From the Templates tab you can access the Protocol Templates window, where you can create a new or open an existing protocol template in the Protocol Editor window. Using the Protocol Editor, you can create custom protocols that are specific to the thermal cycling phase of the QX ONE Droplet Digital PCR System.
Chapter 4 Creating or Editing Thermal Cycling Protocol Templates

Thermal Cycling Protocol Editor Window

The Thermal Cycling Protocol Editor includes:

- Standard protocol controls to quickly create or edit protocols
- Ability to quickly calculate a gradient for a specific temperature range
- Ability to quickly calculate run time for the plate type
- Ability to edit protocol steps
- Ability to save protocols for reuse

By default, the window opens to a generic 4-step protocol

LEGEND

1. The top section provides quick access to the name of the protocol, estimated protocol run time, and save or cancel functions.

2. The upper pane displays the protocol controls that you can use to customize the protocol.

3. The main pane displays a graphical representation of the protocol.
The lower pane displays the following toolbar commands:

- The trashcan command deletes the selected step.
- The plus sign to the left of the trashcan adds a step before the selected step.
- The plus sign to the right of the trashcan adds a step after the selected step.

**Opening a New Thermal Cycling Protocol Template**

QX ONE Software provides the following two options to open a new protocol template:

- From the Template Setup window
- From the Add Plate window

**To open a new protocol template from the Template Setup window**

1. In the Template Setup window, select the Thermal Cycling Protocol tab.
   
   The Thermal Cycling Protocol window appears, displaying a list of sample and custom protocol templates.

   
   The Protocol Editor window opens, displaying the default 4-step protocol.

**To open a new protocol template from the Add Plate window**

1. In the Plate Setup window, tap Add Plate.

2. After the plate is loaded, tap Configure Plate.
   
   The Plate Setup window opens, displaying the Required Plate Information window.

   
   The Protocol Editor window appears, displaying the default 4-step protocol.
Opening an Existing Thermal Cycling Protocol Template

QX ONE Software provides sample thermal cycling protocol templates that you can edit and save as new templates. You can also edit and save a custom protocol as a new protocol template.

To open an existing protocol from the Template Setup window

1. Select the Thermal Cycling Protocol tab.
   The Thermal Cycling Protocol window appears, displaying a list of sample protocol templates.
2. Locate the protocol of choice.
3. Select the protocol and tap Edit Protocol at the bottom of the window.
   The protocol opens in the Thermal Cycling Protocol Editor window.
4. (Optional) tap Save to save the protocol with a new name or in a new storage location.

To open an existing protocol from the Add Plate window.

1. In the Plate Setup window, tap Add Plate.
2. After the plate is loaded, tap Configure Plate.
   The Plate Setup window opens, displaying the Required Plate Information window.
3. In the Thermal Cycling Protocol pane, tap the Choose Existing dropdown arrow, and then select an existing protocol.
4. Click the “i” button to the right of the dropdown arrow.
   The Protocol Editor window opens, displaying the selected protocol in a pop-up window.
5. Click Edit.
6. Continue to Adding Steps to a Protocol Template on page 47.
Adding Steps to a Protocol Template

To add a step to a protocol template

1. In the Protocol Configuration window, determine where to insert the new step. Step 1 is selected by default.

You can add a step before or after an existing step.

2. On the graph, select a step and do one of the following:
   - To insert the new step before the selected step, tap the + icon to the left of the trash can.
   - To insert the new step after the selected step, tap the + icon to the right of the trash can.

3. Do one of the following:
   - To make the step a gradient step, tap the Gradient checkbox.
   - To make the step a goto (repetition) step, tap the Goto checkbox.

   **Note:** If the step type can be converted to Goto, the Goto checkbox is enabled.

4. Do one of the following:
   - To adjust the values in the protocol step options before saving, see Adjusting Step Options on page 48.
To save the protocol with the default step values, tap Save. In the Save dialog box, enter a name for the protocol and tap Save again.

**Note:** The protocol closes after you save it. You can reopen the protocol from the Protocol Templates window.

### Adjusting Step Options

QX ONE Software enables you to change the step options in an existing or added step to customize the protocol. You can set values for the following step types:

- Temperature
- Gradient
- Goto

**Important:** You can save the changes to the steps as you go, or save them all at once when you are finished with your modifications.

**To configure a temperature step**

1. From the graph, select the temperature step containing the parameters to be changed.

   Temperature steps contain a single temperature line.

2. Under Step Options, change or enter the following values where applicable:

   - Temperature (°C)—target temperature (0 to 100°C) for the step
   - Time (HH:MM:SS)—hold time (0–64800 sec) for the step
     
     The hold time is the duration after the block has reached the target temperature.
   - Ramp Rate (°C/sec)—(Optional) the rate (0.1–5°C per second) at which the instrument heats or cools to achieve the target temperature.
   - Increment (°C/cycle)—(Optional) the degrees to increase or decrease the step's temperature with each successive cycle. The entry must be between -10 and 10°C
   - Extend (sec/cycle)—(Optional) amount of time (-60–60 sec) to increase or decrease the step's hold time with each successive cycle.
To configure a gradient temperature step

1. From the graph, select the gradient step containing the parameters to be changed.
2. Under Step Options, change or enter the following values where applicable:
   - Temperature (°C)—temperature (30.0–99.0°C) of the last row in the plate.
   - Time (HH:MM:SS)—hold time (0–6480 sec.) for the step.
     Hold time is the duration after the block has reached the target gradient.
     
     **Note:** Setting the time to 0 sec instructs the instrument to hold at the current step until resumed manually from the instrument’s user interface.
   - Extend (sec/cycle)—(Optional) amount of time (-60–60 sec) to increase or decrease the step's hold time with each successive cycle.
   - Range—(1°C–16°C) range between the lowest temperature and the highest temperature.
     
     **Note:** The temperatures for rows A through H automatically populate with updated values when you change the temperature or temperature range. You can also change the temperature for each row, and the temperature and range are automatically updated.

To configure a goto (repetition) step

A Goto step loops back to an earlier step and repeats a sequence.

1. From the graph, select the Goto step containing the parameters to be changed.
2. Under Step Options, change the following value, if applicable:
   - Goto step number—step to which to return to repeat a sequence
   - Number of repeats—number of times to repeat the sequence

Deleting Steps from a Protocol Template

**Important:** You cannot undo this function. Take care when deleting steps.

To delete a step in the protocol

1. Select the step in the graph.
2. Tap Delete Step.
3. Save the protocol.
Chapter 4 Creating or Editing Thermal Cycling Protocol Templates
Chapter 5 Data Analysis Module Overview

As the instrument reads droplets in each well, the QX ONE Droplet Digital PCR System collects raw data. At the end of each run, QX ONE Software uses the raw data to produce a data file, which contains analysis information based on the number of positive and negative droplets identified for each target in each sample. The fraction of positive droplets is fit to a Poisson algorithm to determine the starting concentration of the target DNA molecule in units of copies/µl input.

When you open the data file in the Analysis module, you can view the data with the automatic analysis thresholds and calculations, or you can choose different options to recalculate, replot, or recolor the results.

When you select the Data Analysis tab from the touch screen, you can access the Data Analysis module. When you select the tab from the software installed on a standalone computer, you can also access the Gene Study module.

The Data Analysis module functionality allows you to:

- View your droplet data in 1D, 2D, and 3D plots
- Analyze multiple targets within a well using amplitude multiplexing and probe mixing strategies
- Detect genomic editing events and non-wild type events with a “drop-off assay” analysis option
- Visualize and export data with improved flexibility
- Generate reports for different analysis types
Chapter 5 Data Analysis Module Overview

The Gene Study module allows you to

- Collect data by adding one or more data files
- View gene expression calculations across multiple experiments

**Note:** The maximum number of samples you can analyze in a gene study is limited by the size of the computer’s RAM and virtual memory.

This section summarizes the analysis functionality, and also describes the general options governing your chart displays. More detailed information, including specific information and uses for each analysis window, as well as information on data calculations, is contained in Chapter 6, Data Analysis Methodology.

For information on analysis reporting, see Report Elements on page 115. For information on gene studies, see Gene Study Module on page 125.

**Opening a Datafile for Analysis**

You can open the following file types in the Data Analysis module:

- **.qlps**
  
  When you save this file type in QX ONE Software, the software automatically saves the file as a .ddpcrsone file. This creates a new file and does not overwrite the original.

- **.ddpcrs**
  
  When you save this file, the software automatically saves it as a .ddpcrsone file. This creates a new file and does not overwrite the original.

- **.ddpcrsone**

  Analysis data files are typically stored in one of the following defined storage locations:

  - Personal folder for the individual user on the touch screen computer or the system folder specified for Preferred locations in the System Settings window
    
    **Note:** Your personal folder location is displayed in your user preferences. You can open the System Settings window to see the preferred or shared storage locations.

    **Important:** If your system administrator has specified preferred location file paths for all users, the file paths specified in user preferences are overridden.

  - Shared folder in a different location, such as a network path
    
    **Note:** The software also saves data files to a shared folder if it is accessible.
To open data files, you must be on a computer on which QX ONE Software is installed and have access to the storage locations.

**To open a data file for analysis**

1. Open QX ONE Software and log into the application.
2. Select the Data Analysis tab.

Available data files are displayed under the following headings.

- **Recent Datafiles**
  Displays a list of files you have recently opened.

- **System Datafiles or My Datafiles**
  Only one of the following locations is available:
  - If your system administrator has enabled Preferred Locations for all users, all data files are stored in that folder, and files appear under System Datafiles.
  - If preferred locations are not enabled for all users, your data files are saved to your personal folder and appear under My Datafiles.

- **Shared Datafiles**
  Displays a list of data files saved to the shared location, if one has been specified in the System Settings window.

**Important:** Data files are always saved to either My Datafiles or System Datafiles, data files are also saved to the Shared location (such as a network directory) if it is accessible when the software saves the data file.

3. Tap a file to open it in the Analysis module.

Tabs for each analysis and data window appear on the left of the Analysis window.

**Tip:** From the touch screen, you can also open the data file from the Run Status window. In the completed files section, tap the completed run icon (✔️) for the file, and then tap Launch Analysis.
Analysis Dashboard

When you open a data file, the Analysis module opens to a Dashboard window containing default analysis and data panes in a summary view. You can customize the view to increase or decrease the number of panes that appear in the Dashboard, and you can also change the selection of panes that appear.

For information on the available options in the Dashboard view, see Dashboard Options on page 55.

Note: If you open a .qlps file, the Plate Editor opens as the default view and you must select the Dashboard tab to open it.

From the tabs on the left, you can access plate views, amplitude charts, statistical probability distribution charts, droplet counts, and a complete data table. You can also view data specific to the run in the Run Information window, and run reports on any of the analysis charts from the Reports window.
Dashboard Options

From the Dashboard window, depending on the individual dashboard window you have selected, you can use a range of options as described below:

- When you select a window, the options that appear in the menu bar correspond to the options you see if you open the same window from the side menu. For example, if you select the Dashboard Concentration chart, the Concentration menu options appear.

- You can reset the entire dashboard display by adding or removing rows or columns to display more or fewer individual windows.

  Tap Default View to return to the default display of two rows and two columns.

- From any window you can
  - Expand or collapse the window
  - Copy, save, or print the image
  - Select display, scale, axis, and logarithmic options
  - Use the dropdown list to replace the current display with a different display
  - Use the menu bar options for the particular chart type

Table 10 on page 56 describes the option sets identified in the following graphic.
### Table 10. Dashboard options

Analysis Display and Output Options

QX ONE Software provides the following miscellaneous option types in the Analysis module:

- **Universal Options** — available from the primary toolbar to save, import, or export data files
- **Chart Display Preferences** — to change how your chart appears in the analysis window
- **Chart Scale Options** — to change the scale represented on an axis
- **Chart Menu Options** — available in chart views (from the icon) to copy, save, and print chart images. In Amplitude charts showing data points, you can show or hide
- **Table Menu Options** — available in table views (from the icon) to copy data, export data to Excel or CSV files, and show or hide columns

You can also expand the chart display to full-screen size and then return to the original display.

**Universal Options**

Universal options are explained in Table 11, and are available in all Analysis module windows.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save</td>
<td>Saves changes to the analysis file under its current file name or file extension</td>
</tr>
<tr>
<td>Save as</td>
<td>Saves the file as a different file extension (for example, .q1ps or ddpcrs to .ddpcrsone, or saves changes to the file under a different file name)</td>
</tr>
<tr>
<td>Import/export</td>
<td>Imports or exports plate setup data</td>
</tr>
<tr>

</tbody>
</table>
Chapter 5 Data Analysis Module Overview

To save the data file

1. Tap Save or Save As.
   - If you tap Save, the software immediately saves any changes you made under the original file name.
   - If you tap Save As, continue to Step 2.
2. In the Save As dialog box, enter a new file name.
3. (Optional) enter a file location.
4. Tap Save.
   The file is saved with the new file name.

To import or export setup or analysis data

1. Tap Import/Export.
   Table 12 describes the available import/export options.

   Note: If there is unsaved data, the software prompts you to save the file before its contents can be imported or exported.

Table 12. Import/export options

<table>
<thead>
<tr>
<th>Import/export option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import plate setup CSV</td>
<td>Import plate layout data from a CSV file to the Plate Editor</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This option is only available in the Plate Editor. The new plate layout overwrites the existing layout.</td>
</tr>
<tr>

</tbody>
</table>

**Note:** Amplitude plots are available in 1D, 2D and 3D, and statistical probability charts are Concentration, Copy Number, Ratio, and Fractional Abundance. In the Dashboard view corresponding options are available for each plot or chart displayed.

**Expanding or Reducing the Chart**

You can expand or reduce the chart size in the following windows:

- Dashboard
- 1D Amplitude
- 2D Amplitude
- 3D Amplitude
- Concentration
- Copy Number
- Ratio
- Fractional Abundance
- Event Counts

If you expand an amplitude or statistical probability chart to full size, the Well Selector and the Well Data table are hidden from view until you collapse the chart again.

**To expand or reduce the chart size**

1. To increase the chart size to the full window, tap the icon in the upper-right corner of the chart.
2. To reduce the window to its original size, tap the icon.
Selecting Chart Display Preferences

The Chart Display preferences primarily control font sizes and positioning. Table 14 explains each preference, as well as the windows in which it is available.

Table 14. Chart display preferences

<table>

<td></td>
</tr>
</tbody>
</table>
To select chart display preferences

1. Tap the Chart Display button.
2. Select your options.
   The display changes immediately to reflect your choices.
3. Do one of the following:
   - To save your choices as your default settings, tap Save as my default. When the success message appears, tap OK to close the dialog.
   - To close the menu without saving the settings, tap anywhere in the chart display.

Selecting Chart Scale Options

Chart scale options primarily control chart scale displays.

Each preference, as well as the windows in which it is available, is explained in Table 15.
### Table 15. Chart scale options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Scale        | Appears in options for all charts  
|              | The Scale option determines the numerical range for your chart data:  
|              | Auto — Selected by default; QX ONE Software automatically displays a scale to match the data distribution.  
|              | Fixed — Selecting Fixed enables the Axis fields, and allows you to manually adjust the range and increment.                              |
| Axis         | Appears in options for all charts  
|              | When the Axis fields are enabled, you can manually adjust the minimum (Min) and maximum (Max) points for the data display on each axis, as well as the increments (Incr).  
|              | X — Horizontal axis  
|              | Y — Vertical axis  
|              | **Note:** You can modify the x axis scale in the 2D Amplitude chart only.                                                                |
| Secondary Y Axis | Appears in options for Concentration only  
|               | From the dropdown list, you can select from Channel 2 concentration, ratio, copy number, or fractional abundance to display the corresponding data in a secondary row on the y axis. |
| Log          | Appears in options for all statistical probability charts (Concentration, Copy Number, Ratio, and Fractional Abundance)  
|              | You can select the Log checkbox to display the y axis in base 10 logarithmic format.  
|              | **Note:** In the Concentration chart, you can also select Log for the secondary y axis.                                                   |
| Inverse      | Appears in options for Ratio and Fractional Abundance only  
|              | The Inverse option equals the opposing number of the Ratio data point to a total of 2, and the opposing number of the Fractional Abundance data point to a total of 100. |
| Data labels  | Appears in options for all statistical probability charts  
|              | A data label appears by default for each point in the chart, but you can clear the checkbox to remove the labels.                          |
| Grid Lines   | Appears in options for all charts  
|              | Gridlines appear by default. You can clear the check box to remove them.                                                                |
To select chart scale options

1. Tap the icon in the upper-left corner of the chart to display the corresponding chart options.
2. To manually define the chart scale, select Fixed.
   
   **Note:** Auto is the default setting.
3. In the Min, Max, and Inc fields, enter your lower and upper limits, and the increment, for the y axis. For 2D Amplitude, you can also change the scale on the x axis.
4. For Concentration, Copy Number, Ratio, Fractional Abundance, and Event Counts, select an option for a secondary y axis display. To change to a base 10 logarithmic scale on the y axis, select the Log checkbox.
5. For Ratio and Fractional Abundance, to view an inverse calculation, select the Inverse checkbox.
6. To remove the data labels or grid lines from the display, clear the Data Labels or Grid Lines checkbox.

**Using Chart Menu Options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy</td>
<td>Copies the chart to the clipboard, which you can paste into a separate document, such as an MS Word file</td>
</tr>
<tr>
<td>Save Image as</td>
<td>Saves the chart as an image file</td>
</tr>
<tr>
<td>Print</td>
<td>Prints the image</td>
</tr>
<tr>
<td>Show Point Values</td>
<td>Shows corresponding point values when you pause on a data point</td>
</tr>
</tbody>
</table>

**Tip:** Select the Show Point Values checkbox to see the data. Data is available for 1D and 2D amplitude only.
Chart menu options are available in the following windows:

- 1D Amplitude
- 2D Amplitude
- 3D Amplitude
- Concentration
- Copy Number
- Ratio
- Fractional Abundance
- Event Counts

To use the chart menu options

1. Select wells in the Well Selector.

Corresponding data appears in the Well Data table and the associated chart.
2. In the upper-right corner of the chart, tap the menu icon (≡) and select from the dropdown list.
   - Select Copy to copy the chart to the Clipboard.
     - **Note:** To paste the data, navigate to the location (for example, a Word file), then right-click and select Paste.
   - Select Save Image As and follow the prompts to save the file.
   - Select Print and follow the prompts to print the image.

3. Tap anywhere in the display to close the dialog box.

### Using Table Menu Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy</td>
<td>Copies the information from the selected wells to the clipboard</td>
</tr>
<tr>
<td>Export to Excel</td>
<td>Exports the data to an .xlsx file</td>
</tr>
<tr>
<td>Export to CSV</td>
<td>Exports the data to a .csv file</td>
</tr>
</tbody>
</table>

Table menu options are explained in **Table 17**.

**Table 17. Table options**
### Table 17. Table options, continued

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show/Hide Columns</td>
<td>Add or remove columns from a table display</td>
</tr>
<tr>
<td></td>
<td>When you select Show/Hide Columns, the following dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>Select or clear check boxes to show or hide columns in the data table.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Select All</td>
<td></td>
</tr>
<tr>
<td>Well</td>
<td></td>
</tr>
<tr>
<td>Sample description 1</td>
<td></td>
</tr>
<tr>
<td>Sample description 2</td>
<td></td>

</tr>
<tr>
<td>Status</td>
<td></td>
</tr>
<tr>
<td>Experiment</td>
<td></td>
</tr>
<tr>
<td>SampleType</td>
<td></td>
</tr>
<tr>
<td>TargetType</td>
<td></td>
</tr>
<tr>
<td>Supermix</td>
<td></td>
</tr>
</tbody>
</table>

Table menu options are available in the following windows:

- 1D Amplitude
- 2D Amplitude
- 3D Amplitude
- Concentration
- Copy Number
- Ratio
- Fractional Abundance
- Event Counts

**Tip:** You can access the menu icon from the individual windows, or from the windows in the Dashboard display.

**To use the table menu options**

If you are using these options in the Data Table, skip to Step 3.
1. Select wells in the Well Selector.

Corresponding data appears in the Well Data table.

2. In the upper-right corner of the table, tap the menu icon ( ) and select from the dropdown list.
   - To copy the data from the selected wells to the Clipboard, select Copy.
     
     **Note:** To paste the data, navigate to the location (for example, an Excel file) and then right-click and select Paste.
   
   - To export your data, select Export to Excel or Export to CSV, and then follow the prompts to save the file.
     
     **Note:** Exporting to Excel exports the data in spreadsheet format, while Exporting to CSV exports the data in comma-delimited format.
   
   - To show or hide the corresponding column in the table, select Show/Hide Columns, and then select or clear checkboxes.

3. Tap anywhere in the display to close the dialog box.
Plate View Windows

In the QX ONE Software Analysis module you can open the following windows that contain data on all wells in the run:

- **Plate Editor (analysis view)** — Displays the experiment type, sample names, sample types, supermixes, and assay type for each well in the run (similar to the Template Setup Plate Editor)
- **Plate View** — Displays concentration results in a text format for each processed well
- **2D Plate View** — Displays a two-dimensional amplitude chart for each processed well
Plate Editor — Analysis View

You can use the Plate Editor tab in the Analysis module to select wells, and then view or change the experiment parameters. Similar to other Plate Editor displays, the Analysis Plate Editor displays the experiment information for each well in the run.

Important: You can change all fields except the supermix.

Wells you select in the Analysis Plate Editor — except for 3D amplitude where you select from a dropdown menu — determine the data initially displayed in other analysis windows.
Plate View

The Plate View tab provides, within the plate layout grid, a text view of the calculated concentration for each target in each well processed in the run. For information on the concentration results in chart format, see Concentration on page 106.
2D Plate View

To facilitate comparisons of amplitude in the processed wells, the Plate 2D tab provides a two-dimensional amplitude view in a separate chart for each well. To see a larger representation of a well, select the well in the 2D Amplitude view.
Analysis Windows

In its Analysis module, QX ONE Software provides amplitude displays and statistical probability charts in the Analysis module.

Amplitude Charts

Amplitude charts illustrate the droplets by degree of dye fluorescence. QX ONE Software displays fluorescence for positive and negative targets identified with FAM, HEX/VIC, Cy5, and Cy5.5 fluorophores in the following analysis windows:

- 1D Amplitude
- 2D Amplitude
- 3D Amplitude

Statistical Probability Charts

Statistical probability charts show calculations based on positive droplet concentrations. QX ONE Software counts the number of positive and negative droplets for each fluorophore in each sample, and then fits the fraction of positive droplets to a Poisson algorithm to determine the starting concentration of the target DNA molecule in units of copies/µl input in the following analysis windows:

- Concentration
- Copy Number
- Ratio
- Fractional Abundance

When you open the analysis data file in QX ONE Software and select one or more wells in the grid, the software plots each calculated Poisson probability distribution average as a data point in the grid. You can pause on the data point to see the high, median, and low numbers.

Note: You can display the data using a confidence level of either 68% or 95% (default setting).

Event Counts

Event counts record the number of droplets in which the target was found (positive) and was not found (negative). The Event Counts tab shows a bar chart view of the number of positive, negative, and total droplets for each of the targets in each of the selected wells.

For more detailed information, see Chapter 6, Data Analysis Methodology.
Chapter 5 Data Analysis Module Overview

Data Windows

QX ONE Software provides the following table views for your well and run data:

- **Data Table** — available from the main tabs on the left, shows your configured experiment parameters, plus all calculations from the run.
  
  **Note:** You can display the data in individual well format, merged format, or both.

- **Plate Well Data Table** — available in plate setup windows (including the Analysis module Plate Editor), shows only your configuration information for each individual well.

- **Analysis Well Data Table** — available in the Analysis module, shows a subset of configuration and run data for the wells selected in the Well Selector.

Data Table Tab

The Data Table window contains columns of data generated for each target in each well, as droplet clusters are identified through thresholding or manual clustering tools.
## Data Table Column Definitions

Table 18 defines each field in the Data Table.

### Table 18. Data Table columns

<table>
<thead>
<tr>
<th>Column name</th>
<th>Content description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Well</td>
<td>The well location in the plate</td>

Viewing Run and Lot Information

Use the Run Information window to view information on the run and view or add post-run notes regarding the plate.

For information on displaying your used lots in the Run Information window, see Showing Lots in Run Information Output and Reports on page 86.

Use the Run Information window to view the following information on the run:

- Instrument, plate, and protocol identifiers, and number of wells processed
- Supermix and oil used
- Incremental processing times
- Lots used for GCR96 cartridges, QX ONE Droplet Digital PCR System Droplet Generation Oil, and QX ONE Droplet Reader Oil
  
  **Note:** You can use this information to manage your lot inventories.

- Thermal cycling temperature data
You can also view or add post-run notes regarding the plate.
Showing Lots in Run Information Output and Reports

After you have set up your lots, you can ensure that lots appear in the Run Information screen of your analysis files.

To show the lots in Run Information

1. Click Add Plate, then click Configure Plate.
2. Select the Lot Selector tab.
3. For consumables and reagents
   a. Select each applicable lot for the run
   b. After each selection, click Select Lots.
4. Continue setting up the plate until the Start Run button is enabled.
5. Click Start Run.
6. When the run is completed, open the analysis file.
7. Click the Run Information tab to see the used lots.

To show the lots in a report

Ensure the Lot Information check box is selected in the report elements before running the report.
Chapter 6 Data Analysis Methodology

As summarized in Chapter 5, Data Analysis Module Overview, the software presents analysis data in several different formats. When you open the data file in the Analysis module, you can view the data with the automatic analysis thresholds and calculations or you can choose different options to recalculate, replot, or recolor the results.

Data is shown in the following formats:

- **Amplitude**, which shows each droplet in each well in a scatter plot, in one-dimensional, two-dimensional, or three-dimensional views
- **Statistical models**, which show estimated target molecule concentration, ratio, and fractional abundance of one target against another target based on selected error model and confidence interval
  
  **Note**: Copy number variation is also calculated if the user ran a CNV experiment.
- **Event counts**, which are precise counts of positive and negative droplets for each target in each well

**Amplitude Plot Analysis Options**

QX ONE Software provides three amplitude plot displays in which you can view the data with automatic thresholding where applicable, or choose different options to replot or recolor the results.

In the 1D amplitude and 2D amplitude plots, you can

- **Show well calculations**
  
  **Note**: The 1D amplitude plot shows the data for each selected well in its own section, while the 2D amplitude plot shows all selected wells together.
- **Modify thresholds**
- **View data in a heat map**
- **View histograms (1D amplitude tab only)**
- **Re-apply automatic analysis**
- **Apply tilt correction to automatic analysis**
In the 3D amplitude plot, you can

- Rotate the plot to gain a better view of the droplets in 3D orientation
- View thresholds previously set in 1D or 2D amplitude display
- View 2D data behind 3D droplets in clusters or heat maps

Table 21 explains the analysis options that are available in both 1D amplitude and 2D amplitude plots.

**Table 21. 1D and 2D amplitude tool options**

</tr>
</tbody>
</table>
Table 22 explains the analysis options available only for 1D amplitude plots.

**Table 22. 1D amplitude tool options**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Threshold, single well</td>
<td>For a single well or multiple wells, the user can manually input thresholding values in the 1D amplitude plot.</td>
</tr>
<tr>
<td></td>
<td>Threshold, multiple wells</td>
<td>You can tap anywhere in the plot to apply threshold lines to the data.</td>
</tr>
</tbody>
</table>
|      | **To adjust the threshold values** | ▶ Drag the lines horizontally in the plot area  
    ▶ Enter a new threshold value in the boxes at the end of each threshold line  
    ▶ Tap the up and down arrows to incrementally adjust the numbers |
|      | Threshold, single well SD   | For a single well or multiple wells, QX ONE Software automatically calculates and populates thresholding values with standard deviations (SD). |
|      | Threshold, multiple wells SD| Important: SD thresholds are not recommended for RMD, since these clusters are not typically located at right angles to each other.  
                         Note: The SD thresholds are set at a limit that is less than the mean number of positive targets, and more than the mean number of negative targets. Starting from where the user clicks in the plot, SD locates the threshold between the positive and negative clusters such that the classification error is minimized. |
|      | Show histogram              | Hides or displays histogram plots for 1D amplitude                                                                                         |

</tr>
<tr>
<td></td>
<td></td>
<td>that the classification error is minimized.</td>
</tr>
</tbody>
</table>
Use the Threshold Cluster icons to establish thresholds across a pair of channels, dividing droplets into distinct clusters separated by different colors.

To classify your droplets, you can:

- Tap any of the three Threshold Cluster Mode buttons (square, circle, or free form)
- Draw the chosen shape around the cluster of droplets

**Note:** When using the cluster mode tools to draw a shape around a cluster of droplets, a dialog box with color selections by target appears in the window to help you select the correct target combination.

Target names are shown along the two axes based on the signal values assigned during plate setup. Tap the colored box that best represents the location of the cluster of droplets selected to automatically classify the droplets as positive or negative for each given target.

**Note:** The Cluster dialog box display varies according to the plex mode.

**Table 24** explains the analysis options available only for 3D amplitude plots.

1D Amplitude

Use the 1D Amplitude analysis window to view droplet amplitudes for each channel, in selection order, for each well selected in the Well Selector.

The 1D Amplitude plots illustrate:

- All accepted droplets, with a visual representation of the positive and negative droplets in each well

Positive droplets appear in color, while negative droplets appear in grayscale. The Well Selector displays an A in each well where QX ONE Software automatically thresholded the droplet data. If you create a manual threshold, the Well Selector displays an M in the wells where the threshold changed.

- Amplitude in a histogram plot
Chapter 6 Data Analysis Methodology

The histogram displays frequency of droplets at specific fluorescence amplitudes for each well or group of wells selected. The Channel 1 (FAM) histogram appears in blue and Channel 2 (HEX/VIC) histogram in green.

![Histogram Image]

**Note:** The Histogram icon is enabled by default so a Histogram plot appears automatically for each fluorophore (channel).

- Amplitude in a Heat Map view

![Heat Map Image]

When you select the 1D Amplitude tab, the toolbar options that allow you to change thresholds and show or hide the heat map and histogram appear above the plots.

![Toolbar Options]

**Note:** For detailed information on each toolbar option, see [Amplitude Plot Analysis Options on page 87](#).

Default color assignments for 1D amplitude plots are:

- Positive FAM = Blue
- Positive HEX = Green
- Positive Cy5 = Red
- Positive Cy5.5 = Violet
- Negative = Gray
The images in this section display data from a direct quantification experiment involving four targets:

- The FAM plot (FAM dye in channel 1) shows the positive droplets for the first target in blue.
- The HEX plot (HEX dye in channel 2) shows the positive droplets for the second target in green.
- The Cy5 plot (Cy5 dye in channel 3) shows the positive droplets for the third target in red.
- The Cy5.5 plot (Cy5.5 dye in channel 4) shows the positive droplets for the fourth target in violet.

Negative droplets appear in grayscale in each plot.

For experiments where enough droplets are recognized, QX ONE Software automatically configures an amplitude threshold, which distinguishes between positive and negative droplets.

**Note:** Well data must meet certain quality metrics (minimum of 10,000 droplets) before the software will automatically calculate a threshold above which droplets are considered positive. You can use the manual thresholding tools to ensure correct quantification of positive and negative droplets.
By default, the Histogram icon is enabled so the Histogram plot automatically appears with the amplitude plot.

To manually adjust the thresholds

1. Select one or more wells.
2. Tap any of the threshold icons to set manual thresholds:
   - Regular threshold for a single well; when multiple wells are selected, you can set a different threshold for each well
   - Regular threshold for multiple wells, where you can set one threshold for all selected wells
   - Standard deviation threshold for a single well; when multiple wells are selected, you can set a different threshold for each well
   - Standard deviation for multiple wells, where you can set one threshold for all selected wells
3. Tap on the location in the plot where you want to draw the new threshold.
4. When the line appears, use the up or down arrows, or click and drag the threshold, to adjust the location.
QX ONE Software displays the manual threshold and changes the color of the droplets that are now above or below the threshold.

**Note:** You can also manually enter a threshold number.

When you manually modify a threshold, the well selector displays an M for manual instead of the A for Automatic.

5. (Optional) To reset to the automatic threshold, tap Auto.

6. (Optional) To adjust the automatic threshold to consider tilt correction, tap Auto with Tilt.

7. (Optional) To reset everything to the original display, tap Reset.

**To view a heat map representation of the plot data**

▶ Tap the icon.
2D Amplitude

For the wells you select in the analysis view of the Plate Editor, the 2D Amplitude window illustrates fluorescence for four targets.

When you select the 2D Amplitude tab, the toolbar options allow you to change thresholds, manually cluster wells, and show or hide the heat map above the plots. By default, the left plot displays channel 1 and channel 2 data, and the right displays channels 3 and 4, but these combinations can be changed at the top left of the plot. For detailed information on each toolbar option, see Amplitude Plot Analysis Options on page 87.

**Note:** For detailed information on each toolbar option, see Amplitude Plot Analysis Options on page 87.

The images in this section display data from a direct quantification experiment involving four targets.

Default color assignments for 2D amplitude plots are

- Positive FAM = Blue
- Positive HEX/VIC = Green
- Positive FAM and HEX/VIC = Orange (may appear brown on some monitors)
<table>
<thead>
<tr>
<th>Positive</th>
<th></th>

</tr>
</tbody>
</table>

**Note:** Well data must meet certain quality metrics (minimum of 10,000 droplets) before QX ONE Software will automatically calculate a threshold above which droplets are considered positive. You can use the manual thresholding tools to ensure correct quantification of positive and negative droplets.

**To use the 2D amplitude tools**

1. Open your data file in the Analysis module and select the 2D Amplitude tab.
2. Choose a threshold line or cluster option.

   **Note:** Use the cluster option when the data is not orthogonal and the threshold lines do not adequately divide the populations of droplets.

   - To adjust threshold lines, select a threshold line type (a) and then tap in the plot to apply crosshair lines. Use any of the following methods:
     - Drag the lines horizontally or vertically in the plot area.
     - Enter a new threshold value in the boxes at the end of each threshold line.
     - Tap the up and down arrows to incrementally adjust the numbers.

   - To adjust thresholds using the cluster option, select a cluster type (b) and draw the chosen shape around the cluster of droplets to classify.
3. (Optional) To reset to the automatic threshold, tap Auto.

4. (Optional) To adjust the automatic threshold to consider tilt correction, tap Auto with Tilt.

5. (Optional) To reset everything to the original display, tap Reset.
3D Amplitude

When you select the 3D Amplitude tab, the toolbar options that allow you to select the well and choose which channels to display appear above the chart.

For the well selected from the toolbar, the 3D amplitude plot illustrates three targets in a single chart.

To use the different 3D amplitude viewing tools

1. Select Well.
2. Select the axis and color channels.
3. Tap Show and a dropdown menu will appear.
4. Select one or more of the Show 2D options to display 2D amplitude data behind the 3D droplets.

   **Note**: You can display data in clusters or as a heat map.

5. Select one or more of the Show Threshold options to display thresholds previously set in the 1D or 2D amplitude display.

   **Note**: You must set thresholds in the 1D or 2D Amplitude charts.
6. To restore the default orientation of the chart, tap Reset Display.

**Statistical Probability Chart Analysis Options**

QX ONE Software also provides chart displays where you can view the data from the original calculations, or choose different options to recalculate the results.

In charts reflecting statistical probability distributions, you can

- Show individual or merged well data.
- Change the error model and confidence level.

**Note:** For event counts, you can also alter the view mode to see positive, negative, or all droplet counts.
Table 25 explains the available options.

Table 25. Chart tool options for statistical probability distribution charts

Chapter 6 Data Analysis Methodology

Concentration

Concentration measures the number of copies of the target molecules in each µl of sample based on the default settings. Use the toolbar to merge or separate the calculated results for each well, and to recalculate your results based on a different error model and confidence interval.

For information on toolbar options, see Statistical Probability Chart Analysis Options on page 103.

The following image displays concentration data, across a sequence of wells.

QX ONE Software plots the averaged concentration for each target as a data point. Pause on a data point to see the high, median, and low numbers.
The software uses the formula and variables shown below.

**Concentration Calculation**

\[ c = -\ln\left(\frac{N_{\text{neg}}}{N}\right)/V_{\text{droplet}} \]

Where:

- \(\ln\) Negative natural logarithm
- \(V_{\text{droplet}}\) Volume of droplet
- \(N_{\text{neg}}\) Number of negative droplets
- \(N\) Total number of droplets

**Confidence Interval Calculation**

Note: If you select a 68% confidence interval, the multiplier is changed from 1.96 to 1.00.

\[ P = \frac{N_{\text{neg}}}{N} \]

\[ \hat{\sigma}_{N_{\text{neg}}} = \sqrt{Np(1-p)} \]

\[ N_{\text{neg,min}} = N_{\text{neg}} - 1.96 \times \hat{\sigma}_{N_{\text{neg}}} \]

\[ N_{\text{neg,max}} = N_{\text{neg}} + 1.96 \times \hat{\sigma}_{N_{\text{neg}}} \]

Where:

- \(V_{\text{droplet}}\) Volume of droplet
- \(N_{\text{neg}}\) Number of negative droplets
- \(N\) Total number of droplets
- \(p\) p-value (probability of finding the target in the sample)
- \(\hat{\sigma}\) Delta
Chapter 6 Data Analysis Methodology

Copy Number

**Important:** To see copy number variation data, you must run a copy number variation (CNV) ddPCR experiment.

Copy number measures the probable count of the target gene, relative to the reference gene, to calculate the number gene targets per genome. Use the toolbar to merge or separate the calculated results for each well, and to recalculate your results based on a different error model and confidence interval. For information on toolbar options, see Statistical Probability Chart Analysis Options on page 103.

The following image displays copy number data, across a sequence of wells.

QX ONE Software plots each copy number variation as a data point. Pause on a data point to see the high, median, and low numbers.
The software uses the formula and variables shown below.

\[ CNV = \frac{A}{B} N_B \]

**Where:**

- **A** Target concentration
- **B** Reference concentration
- **N_B** Number of reference copies in genome (usually 2)

**Notes:**

Copy Number analysis involves determining the number of copies of a given target DNA sequence as compared to an invariant reference DNA sequence. Use the CNV analysis to determine structural variations, such as ploidy changes (addition or deletion of chromosomes), deletions (missing partial chromosomes) or duplications (repeated target sequences) in the genome.

The ability to discriminate, with statistical confidence, between consecutive CN states has been a technical challenge in copy number assessment. Fundamentally, as CN state increases, the percentage difference in target genomic material between states decreases. For example, for a given target locus, a CN of 3 is 50% more abundant in concentration per genome than a CN of 2, while a CN of 5 is only 25% more abundant per genome than a CN of 4, and so on.

Due to the massive partitioning of the reaction across up to 20,000 droplets per well, and the absolute nature and precision of the ddPCR concentration measurement, ddPCR CNV analysis enables the quantitative discrimination required to resolve consecutive copy number states beyond CN 3. For example, a 20% difference in target concentration between a CN 5 versus CN 6 sample can be reproducibly resolved using ddPCR. This discrimination is both a function of concentration differences between consecutive CN states, as well as the amount of DNA assayed per well.
Ratio

Ratio determines the quotient of two target molecules in each µl of sample based on the default settings.

T1:T2

Use the toolbar to merge or separate the calculated results for each well, and to recalculate your results based on a different error model and confidence interval. For information on toolbar options, see Statistical Probability Chart Analysis Options on page 103.

The following image displays ratio data, across a sequence of wells.

QX ONE Software plots each ratio as a data point. To see the confidence level numbers, pause on the data point.
The software uses the formula and variables shown below.

\[ r = \frac{A}{B} \]

**Where:**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Target concentration</td>
</tr>
<tr>
<td>B</td>
<td>Reference concentration</td>
</tr>
</tbody>
</table>

**Note:** If no reference is selected, the target with the highest dye concentration in the highest channel will automatically be considered as the reference. If multiple references are selected, the geometric mean is used.

**Fractional Abundance**

Fractional Abundance determines the relative abundance of your targets in each µl of sample based on the default settings. Use the toolbar to merge or separate the calculated results for each well, and to recalculate your results based on a different error model and confidence interval. For information on toolbar options, see [Statistical Probability Chart Analysis Options on page 103](#).

The following image displays fractional abundance data across a sequence of wells.
QX ONE Software plots the fractional abundance as a data point. To see the high and low confidence interval numbers, pause on the data point.

The software uses the formula and variables shown below.

\[ f = \frac{A}{A + B} \]

**Where:**

- \( A \)  
  Target concentration  

- \( B \)  
  Reference concentration

**Note:** If no reference is selected, the target with the highest dye concentration in the highest channel will automatically be considered as the reference. If multiple references are selected, the geometric mean is used.
Event Counts

The Event Counts tab shows a bar chart view of the number of positive and negative droplets for each of the targets in each of the selected wells.

Use the toolbar to change the display by combining or separating data for each well. You can also show data by well name or by sample name, and you can show any combination of positive, negative, or combined droplet counts.
Chapter 7 Analysis Module Reporting

Use the Reporting function to create a variety of reports in the QX ONE Software Analysis module.

You can create reports on the fly from any analysis file or, if you need to generate specific reports on a regular basis, you can set up report templates for reuse.

This section contains information on available report elements, how to create analysis reports, and how to create report templates.

Report Elements

QX ONE Software allows you to generate reports for any or all of the following elements of the run and data.

Run Setup

- Plate Setup
  - Well
  - Perform droplet generation
  - Perform droplet reading
  - Experiment type
  - Sample description 1, 2, 3, and 4
  - Sample type
  - Supermix name
  - Plex mode
  - Target name
  - Target type
  - Signal channel 1, 2, 3, and 4
  - Reference copies
  - Well notes
Chapter 7 Analysis Module Reporting

☐ Plot?
☐ Rdq conversion factor

- Plate name
- GCR type
- Supermix information
- Thermal cycling protocol name
- Number of wells read
- Selected wells for report
- Username of the person who did the run
- Run start time
- Run complete time
- Initial wait elapsed time
- DG elapsed time
- Droplets wait time
- TC elapsed time
- DR elapsed time
- Errors
- Instrument serial number
- Firmware version
- Software version
- Software
- Run notes
- Lot information

1D Amplitude

- Threshold value
- Tilt correction
- Amplitude 1D chart
- Amplitude 1D chart for each well
- Amplitude 1D histogram chart
- Amplitude 1D histogram chart for each well

2D Amplitude
- Threshold value
- Tilt correction
- Amplitude 2D chart
- Amplitude 2D chart for each well

3D Amplitude
- X axis
- Y axis
- Z axis
- Show 3D droplets
- Show 2D XY
- Show 2D YZ
- Show 2D XZ
- Show X axis threshold
- Show Y axis threshold
- Show Z axis threshold
- Show 2D colors
- Amplitude 3D chart for each well

Thermal Cycling Protocol
- Temperature and time per step
- Number of steps

Concentration
- Error model
- Confidence model
Chapter 7 Analysis Module Reporting

- Chart

**Copy Number**
- Error model
- Confidence model
- Chart

**Ratio**
- Error model
- Confidence model
- Inverse
- Chart

**Fractional Abundance**
- Error model
- Confidence model
- Inverse
- Chart

**Event Counts**

**Analysis Results**

**Audit Logs**

The audit log contains all of the original data from the plate run, and also records any changes that were made to the data file. The log records the change number, date, username for the user who made the change, the name of the software, the software version, full user name, instrument or computer name, and the reason for the change. Also recorded in a tabular format are the change type and description, as well as old and new values for all well settings. The description column includes the well number of any affected well, and may also include other descriptive information.
Creating Report Templates

If you are assigned the Create New Templates user privilege, you can create and save a new report template by editing the default report structure or by opening and editing an existing report, and then saving the modified structure as a new template.

Note: For information on creating reports, see Report Elements on page 115.

To create a report template

1. Select the Template Setup tab and tap Reports.

2. Do one of the following:
   - To create a new template, tap Add New Template.
   - To open an existing template, select the template and then tap Edit Report Template.

The default or selected layout appears.
3. Tap the arrow to the left of each item to expand the list of reportable items.
Creating Report Templates

4. Select and clear checkboxes to create the report structure.
   
   **Tip:** Use the buttons at the bottom of the screen to expand or collapse all categories at once, or to select or clear all checkboxes at once. You can also drag and drop the section to rearrange the order of appearance in the report, and drag and drop items in the section to reorder them.

5. In the Report Title field, enter a name for your report template.

6. Tap Save.

7. In the Save dialog box, enter a name for your template file.

8. Select a storage location.

   Choose from the following:
   
   - System Templates or My Templates

   **Important:** Only one of these locations will be valid. If your administrator has specified preferred Locations in System Settings, you can save your templates to the System Templates folder or the Shared folder. If preferred locations are not specified, you can save them to the My Templates folder or the Shared Templates folder.
Chapter 7 Analysis Module Reporting

- **Shared Templates**
  
  You have the option to save your templates to this folder to make them available to all users.

9. Tap Save again to save the report format as a template.

### Creating Analysis Reports

The reporting function allows you to run reports on elements of a run and corresponding analysis data from the Analysis module.

1. Open an analysis data file and tap Reports.
2. Do one of the following:
   - Work in the default report layout, which appears automatically.
   - Select a report template from the Template dropdown list.
3. Tap the arrow to the left of each item to expand the list of reportable items.
4. Keep the original configuration, or select and clear check boxes to create a new report format.
5. Change the order of categories and items in a report. Drag the options to the required position. Items can be reordered only within the categories to which they belong. You can also drag and drop the section to rearrange the order of appearance in the report, and drag and drop items in the section to reorder them.
6. (Optional) Use the options located in the lower portion of the window to expand or collapse the tree, and to select or clear all checkboxes.
7. In the Report Title field, enter a name for your report.

8. (Optional) If the report should be private, select the Password Encrypt Report? checkbox and then enter a password in the Password field.

9. (Optional) To save the structure as a new template, tap Save and then enter a name, and select a storage location.

Choose from:

- Templates you created and saved, which are automatically saved to one of the following paths:
  - The path specified in your user preferences; these appear under My Templates
  - The path specified under Preferred Locations in System Settings, if your system administrator has specified the path for all users, these appear under System Templates

  **Important:** If your administrator has specified the Preferred Location for all users, the path overrides the path specified in user preferences. Preferred locations can be enabled only by users with the System Settings user privilege.

- Templates created and saved by any user and designated as shared; these appear under Shared Templates.

10. To generate the report, tap Generate Report.

    **Important:** You must reenter your password as a validation step each time you generate a report.

QX ONE Software creates a PDF report that opens immediately.

In each page header, the software automatically displays the user name of the person creating the report, date and time stamps, and the name of the analysis file used to generate the report.
Chapter 8 Gene Study Module

You access the Gene Study module from the Data Analysis window.

**Note:** The Gene Study module is not available from the touch screen computer.

To create a gene study, you add one or more data files and then compare gene expression data from one or more ddPCR experiments.

**Note:** The maximum number of samples you can analyze in a gene study is limited by the size of the computer’s RAM and virtual memory.

**To open the Gene Study module**

- Click Gene Study.
The Gene Study dialog box includes two tabs:

- **Study Setup** — manages the run files in the gene study
  
  **Important:** Adding or removing data files in a gene study does not change the data in the original file.

- **Study Analysis** — displays the gene expression data for the combined runs.

From these tabs you can add files to set up a gene study, analyze your data in charts and plots, and run reports on the gene study data.

**Gene Study Options**

The Gene Study module provides the menus and corresponding options described below.

- **File** — Open, save, and close the gene study, and add files
- **Settings** — Restore the default layout
- **Tools** — Create a report
To open a gene study file
1. Tap File ➔ Open.
2. In the Open dialog box, navigate to and select the data file, and then tap Open.

   The file opens in the Gene Study module.

To save a gene study file
1. Tap File and select Save or Save As.
2. If prompted, enter a file name and tap Save.
3. If prompted to overwrite an existing file, tap Yes or No.

To close a gene study file
1. Tap File ➔ Close.

   Note: If you have not saved the file, an advisory prompt appears.

To add data files
1. Tap File ➔ Add Data Files.
2. In the Open dialog box, navigate to the data files to be added to the study.
3. Select one or more files and then tap Open.

   The files are added to the Study Setup window.

To restore default settings
1. Tap Settings ➔ Restore default settings.

   Note: At least one modified data file must be open.

To generate a report
1. See Gene Study Reports on page 135.
Setting up the Gene Study

Use the Study Setup window to

- Add data files to include in the study
- Remove data files from the study
- Select data files for viewing and analysis
- Show the plate view for a data file

Table 27 defines each column in Study Setup.
### Table 27. Gene Study Setup Fields

<table>

</table>

![Gene Study Plate View](image)
Adding Data Files

To add data files

1. On the Study Setup tab, tap Add Data Files.
2. In the Open dialog box, navigate to the data files to be added to the study.
3. Select one or more files and then tap Open.

The files are added to the Study Setup window.

Removing Data Files

To remove data files

▶ Select the checkbox next to the file and then tap Remove.

The file is removed from the Study Setup window.

Note: The Remove button is disabled until you select a file.
Selecting Data Files for Analysis

To select data files for analysis

1. Select the checkboxes next to the files to be included in the analysis.

2. Select the Study Analysis tab to see the analysis results. For information, see Using the Study Analysis Features on page 133.

Showing the Plate View

To show the plate view

1. In the Plate View column, tap the button for the plate view to be displayed.

The Plate view appears.
2. Click Close to close the view.
Using the Study Analysis Features

The Study Analysis tab displays the data from all runs in the gene study in the views described in Table 28.

Creating a Gene Study Report

Before creating a report, make any needed adjustments to the gene study data and charts.

To create a gene study report

1. Select Tools ➔ Reports in the Gene Study menu to open the Report dialog box.

2. Select the options you want to include in the report.

   The report opens with default options selected. Select or clear the checkboxes to change whole categories or individual options within a category.

   For information on the available options to display, see Gene Study Reports on page 135.

3. Change the order of categories and items in a report.

   Drag the options to the required position. Note that items can be reordered only within the categories to which they belong.

4. Click Update Report to update the Report Preview window with any changes.

5. Print or save the report:

   a. Click the Print Report button on the toolbar to print the current report.

   b. Select File ➔ Save to save the report in PDF, MHT or MHTML file format and select a location to save the file.

      **Note:** MHT and MHTML are Microsoft formats.

   c. Select File ➔ Save As to save the report with a new name or in a new location.

6. (Optional) To save the current report settings as a template, select Template ➔ Save or Save As.
Appendix A Experiment Examples

This section contains setup and analysis information for the following sample experiments:

- Direct Quantification, using the Amplitude Multiplex assay type
- Copy Number Variation, using the Probe Mix Triplex assay type
- Drop-Off, using the Basic Drop-off Assay type for genome edit detection
- Direct Quantification, using the Advanced Classification Method assay type
Direct Quantification Multiplexed

You can increase the number of targets to be evaluated by using the Amplitude Multiplex option.

Setting Up Experiment Parameters

To set experiment parameters

1. Open the analysis data file and select the Plate Editor tab.

2. Select one or more wells to be assigned well analysis attributes.

3. Change the experiment type to Direct Quantification (DQ), and then tap Apply.

4. (Optional) Change the sample description identifiers.

5. (Optional) Change the sample type. The default type is Unknown.

   **Note:** You cannot change the supermix that was used during data collection.

6. Under Assay Type, select Amplitude Multiplex and tap Apply.

   Eight target rows appear.

7. Change the target name and type (unknown or reference) for each target in the well.

8. If you select Reference, you can change the number of reference copies. The default is 2.
If no reference is selected, the target with the highest dye concentration in the highest channel is used as the reference. For example, if there are targets in all four channels, the target in Channel 4 is used; however if there are targets only in the first three channels, then Channel 3 is the reference target.

If more than one reference is selected in the well, checkboxes appear to the right for using the reference in the plot.

**Note:** Each Reference target enables ratio calculations in the results.

9. (Optional) Change the high and low target identifiers.

Amplitude Multiplex allows for up to two assays in each channel, indicated by Lo and Hi labels. In this multiplex mode, each target may have a signal for only one channel. You can

- Select a different dye, if the channel supports two dyes (for example change HEX to VIC or VIC to HEX)
- Select a different channel for the target (for example, change FAM to HEX)
- Change Hi to Lo or Lo to Hi

10. Tap Apply.

**Tip:** Optionally, to expedite plate setup you can copy and paste data from one well to another, and you can tap Undo to undo an applied well setting.

**Viewing and Adjusting Results**

Automatic thresholding is not available for Amplitude Multiplex experiments.

For clusters that are easily identifiable across the chart, use Threshold Lines mode to set manual thresholds. If the data is not orthogonal and the threshold lines do not adequately divide the populations of droplets, use Threshold Clusters mode to set manual thresholds.
To set thresholds in the 2D Amplitude window

1. Select the 2D Amplitude tab.

2. On the toolbar, tap the Threshold Line Mode button.

3. Tap anywhere on the plot to apply “best fit” threshold lines to the data.

4. To adjust the thresholds, drag the lines horizontally or vertically in the plot area.

   Tip: You can also enter a specific threshold value in the boxes at the end of each threshold line.

To apply and adjust manual clusters

1. Tap any of the three cluster mode buttons (square, circle, or freehand).

2. Press the left mouse button and draw the chosen shape around the cluster of droplets to be classified first.
**Tip:** When you release the mouse button, a pop-up tool appears to help you select the correct target combination. Target names are shown along the two axis based on the signal values assigned during plate setup.

3. To classify droplets as positive or negative for each given target, select the colored box that best represents the location of the cluster of droplets.
Copy Number Variation Triplexed

A CNV experiment with probe mix triplexing uses two targets and a reference in one or two groups to produce analysis data.

Setting Up Experiment Parameters

To set experiment parameters
1. Open the analysis data file and select the Plate Editor tab.
2. Select one or more wells to be assigned well analysis attributes.
3. Set the experiment type to Copy Number Variation (CNV), and tap Apply.
4. (Optional) Change the sample description identifiers.
5. (Optional) Change the sample type. The default type is Unknown.
   
   **Note:** You cannot change the supermix that was used during data collection.
6. Tap Apply.
7. From the Assay Type dropdown list, select Probe Mix Triplex and tap Apply.
   
   QX ONE Software displays three targets.
   
   **Important:** You cannot add or delete triplex targets.
8. Enter target names and select the target type (unknown or reference) for each target in the well.
   
   This creates two groups of three targets each.
9. Assign the targets as follows:

   **Group 1**

<table>
<thead>
<tr>
<th>Target</th>
<th>Target Type</th>
<th>Signal Ch1</th>
<th>Signal Ch2</th>
<th>Ref Copies</th>
<th>Plot?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target 1</td>
<td>Unknown</td>
<td>FAM</td>
<td>None</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Target 2</td>
<td>Unknown</td>
<td>None</td>
<td>HEX/VIC</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Target 3</td>
<td>Reference</td>
<td>FAM</td>
<td>HEX/VIC</td>
<td>2</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Group 2

<table>
<thead>
<tr>
<th>Target</th>
<th>Target Type</th>
<th>Signal Ch3</th>
<th>Signal Ch4</th>
<th>Ref Copies</th>
<th>Plot?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target 4</td>
<td>Unknown</td>
<td>Cy5</td>
<td>None</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Target 5</td>
<td>Unknown</td>
<td>None</td>
<td>Cy5.5</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Target 6</td>
<td>Reference</td>
<td>Cy5</td>
<td>Cy5.5</td>
<td>2</td>
<td>Yes</td>
</tr>
</tbody>
</table>

10. Tap Apply.

**Tip:** Optionally, to expedite plate setup you can copy and paste data from one well to another, and you can tap Undo to undo an applied well setting.

**Viewing and Adjusting Results**

**Note:** Thresholding is not available for Probe Mix Triplex experiments.

**To see the results**

1. After all wells are configured, select the 2D Amplitude tab to evaluate the data and manually set clusters.
2. Tap any of the three cluster mode buttons (square, circle, or freehand).
3. Press the left mouse button and draw the chosen shape around the cluster of droplets to be classified first.
   
   **Tip:** When you release the mouse button, a pop-up tool appears to help you select the correct target combination. Target names are shown along the two axis based on the signal values assigned during plate setup.

4. To classify droplets as positive or negative for each given target, select the colored box that best represents the location of the cluster of droplets.
Drop-Off Assays for Genome Edit Detection

This type allows two groups of two targets per well; Group 1, shown by default, with 1 target in FAM and HEX (reference), and 1 target in FAM or HEX (unknown). You can add a second group with 1 target in Cy5 and Cy5.5 (reference) and 1 target in Cy5 or Cy5.5 (unknown).

Note: The channels within each group are not interchangeable therefore FAM is always paired with HEX/VIC and Cy5 with Cy5.5.

Setting Up Experiment Parameters

To set experiment parameters

1. Open the analysis data file and select the Plate Editor tab.
2. Select one or more wells to be assigned well analysis attributes.
3. Set the experiment type to Drop-Off (DOF) and tap Apply.
4. (Optional) Change the sample description identifiers.
5. (Optional) Change the sample type. The default type is Unknown.
   
   Note: You cannot change the supermix that was used during data collection.

6. Tap Apply.
   
   QX ONE Software automatically assigns the assay method as Basic Drop-Off.

7. Enter the target names, and then designate one target as Reference and the other as Unknown.
   
   The Reference target enables ratio calculation of results.

8. Tap Apply.
Tip: Optionally, to expedite plate setup you can copy and paste data from one well to another, and you can tap Undo to undo an applied well setting.

Viewing and Adjusting Results

Thresholding is not available for Drop Off experiments.

To apply and adjust clusters

1. After all wells are configured, select the 2D Amplitude tab to evaluate the data and manually set clusters.
2. Tap any of the three cluster mode buttons (square, circle, or freehand).
3. Press the left mouse button and draw the chosen shape around the cluster of droplets to be classified first.

   Tip: When you release the mouse button, a pop-up tool appears to help you select the available cluster assignments. Target names are shown along the two axis based on the signal values assigned during plate setup.

4. To classify droplets as positive or negative for each given target, select the colored box that best represents the location of the cluster of droplets.
Direct Quantification with the Advanced Classification Method

The Advanced Classification Method analysis mode allows the user complete control of droplet identification, and does not force or preassign any clusters. This allows a higher degree of multiplexing through radial dye mixing.

Important: This mode is intended for experienced users of droplet digital PCR.

Setting Up Experiment Parameters

To use the advanced classification method

1. Open the analysis file and select the Plate Editor tab.
2. Select one or more wells to be assigned well analysis attributes.
3. Set the experiment type to Direct Quantification (DQ) or RED and tap Apply.
4. (Optional) Change the sample description identifiers.
5. (Optional) Change the sample type. The default type is Unknown.
   Note: You cannot change the supermix that was used during data collection.
6. Tap Apply.
7. Under Assay Type, select Advanced Classification Method and tap Apply.
8. Use the + icon to add up to ten targets.
9. Enter the target name and type (unknown or reference) for each target in the well.

10. (Optional) If you select Reference, you can change the number of reference copies. The default is 2.

- If no reference is selected, the target with the highest dye concentration in the highest channel is used as the reference. For example, if there are targets in all four channels, the target in Channel 4 is used; however if there are targets only in the first three channels, then Channel 3 is the reference target.

- If more than one reference is selected in the well, checkboxes appear to the right for using the reference in the plot.

**Note:** Each Reference target enables ratio calculations in the results.

11. Assign the first target an expected signal in a channel.

12. Assign your last target a signal in a channel that was not selected for your first target.

Each target in between will be assigned a signal depending on mixture ratio of the target.

13. Tap Apply to confirm all well settings.

**Tip:** Optionally, to expedite plate setup you can copy and paste data from one well to another, and you can tap Undo to undo an applied well setting.

**Viewing and Adjusting Results**

1. Tap the 2D Amplitude tab.

   All droplets are unclassified by default and are colored red. Only the Threshold Cluster mode is available for setting thresholds in Advanced Classification experiments in the 2D plot.

2. Use one of the Threshold Cluster mode tools (box, circle or freehand) to assign droplet clusters to targets.

   When you select a droplet cluster, a cluster assignment box appears.

3. Select a radio button to identify the composition of the cluster.
For example, if the cluster is composed of positive droplets for Target-2, select the positive radio button for Target-2 and the negative radio buttons for the remainder.

**Important:** For calculations to occur, you must have at least one positive cluster for each target, as well as the assigned negative cluster.

**Note:** The software sets aside unassigned for calculation purposes. If you are unsure of droplet/cluster composition, leave it unassigned (red).

You can view the concentration results in the data table and in the Concentration tab.

If one of your samples was identified as a Reference under AssayType, you can view a ratio of concentration for unknown versus reference in the Ratio tab.
Appendix B Additional Computers

This section explains the recommended standalone computer requirements for QX ONE Software, and provides instructions for installing or updating the software.

Computer Requirements

Standalone computers are for analysis purposes only. The computers should meet the requirements specified in Table 30.

Table 30. Standalone computer requirements

<table>
<thead>
<tr>

</tbody>
</table>

Notes:

(1) The software is compatible with Windows Defender and Trend Micro Office Scan anti-virus applications.

Important: Do not update the anti-virus or perform a scan while the instrument is acquiring wells or data may be lost.

(2) Enabling FIPS security on your Windows 10 computer does not interfere with instrument communication or application functionality.

Installing or Updating the Software

The QX ONE Droplet Digital PCR System must complete all runs and be in an inactive state when you upgrade the software on the installed touch screen computer, or the instrument firmware.
QX ONE Software can also be installed on additional computers.

If you are already logged into QX ONE Software and you have open windows, save your data and close the windows before proceeding with the software update.

When the software is updated, the new version overwrites the existing version. If you are reverting to an older version, you must uninstall the newer version before installing the older version.

For more information on installing QX ONE Software, call Bio-Rad Technical Support.
Appendix C Managing Users

Use the User Setup and Preferences window to add, change, or remove QX ONE Software users, and set or change user privileges and preferences.

The Bio-rad engineer sets up an initial user with all privileges, including Add/Manage users, on the touch screen. Your software administrator can use this account to set up additional users with appropriate privileges.

Note: Users who are not assigned any of the specified privileges can still execute runs and use the Analysis module.

You can set up local or domain accounts. If the instrument touch screen computer

- Can access your company’s network, QX ONE Software can recognize the Active Directory user names.
- Cannot access your company’s network, your IT department can set up user names as local Windows accounts.

You can create user accounts with any user name convention and password character structure, as long as it complies with your organizational requirements. The software is designed to validate each user against the name it finds in either the Active Directory or local domain, so users must log in with the proper domain and user name.
Appendix C Managing Users

However, QX ONE Software must be able to validate the user in either the local or domain user group before you can add the user in the software. Note the following:

- For local IDs, you must set up each user as a local Windows user account on each computer where the software is installed.
- For Active Directory IDs, your IT department must connect the QX ONE Droplet Digital PCR System instrument touch screen, as well as any separate computers running the software, to your network.

Adding Users

Only a user who is assigned the Add/Manage Users privilege can add QX ONE Software users.

Before you begin, ensure that all users have IDs set up in Active Directory or as local accounts.

To add a user

1. In the User Name field, enter the user name and then tap Check Name.

   One of the following occurs:

   - If the software recognizes the user name, the software displays a validation message. Continue to Step 2.
   - If the user is not recognized, an error message appears. Do one of the following:

     - For network users, ensure there is a working connection to the network and then verify your entry is accurate.
     - For local users, verify the entry is accurate. If the user is not set up locally or on the network, contact your system administrator for assistance.

2. When the successful validation message appears, tap OK, and then tap Add.

   The software displays a confirmation message.

3. Tap Yes to add the user, and then tap OK to close the dialog box.
Adding or Removing User Privileges

Only a user assigned the Add/Manage users privilege can add or remove user privileges.

By default, individual users without the privileges described in Table 31 can set up and execute a run, open files, view and analyze results.

Table 31. User Privileges

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add and manage users</td>
<td>Add or remove users, set privileges, and change preferences.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Only the superuser can remove this privilege from other users.</td>
</tr>
<tr>
<td>Create new templates</td>
<td>Save a plate, thermal cycling protocol, or analysis report design as a template.</td>
</tr>
<tr>
<td>View data files created by other users</td>
<td>View files created by other users in the storage folders.</td>
</tr>
<tr>
<td>Overwrite existing data file name</td>
<td>Use Save or Save As capability.</td>
</tr>
<tr>

</tbody>
</table>

*You can assign this privilege to non-administrative roles if anyone can create and save a template. If template formats are restricted, then you should assign this permission to administrative roles only.

Note: Bio-Rad recommends defining at least one additional superuser as a backup, as well as other administrative and standard roles based on your needs. Guest users can open shared templates, execute runs, and perform analysis but are not typically assigned other privileges.

To add or modify privileges

1. Tap the Add/Manage Users tab to open the User Management window.
2. Select a user from the Current Users list. The name appears in the User Name field.
   Note: A network or computer name and backslash may appear before the user name.
3. Select or clear the checkbox for each privilege in accordance with the user's role in using the software.
   You can assign user privileges in any combination.
4. When the confirmation message appears, tap Yes to save the changes, and then tap OK to close the pop-up.
Modifying User Preferences

Users assigned the Add/Manage Users privilege can change the preferences for other users. Individual users can also change their own preferences.

To modify a user's preferences

1. Tap the Add/Manage Users tab, and then enter the user name.
2. Change any of the following preferences for the user:
   - Enter a different file path for user data files and templates.
     Important: You can also specify Preferred Locations in System Settings, which override all file paths specified in individual preferences. For information, see System Settings Tab on page 157.
   - Select or clear the checkbox to change user data file and template privacy settings.
   - Enter a different default system timeout period.
   - Enter a different number of completed plates to show in the Status section, up to a maximum of 100.
3. Tap Save.
   QX ONE Software displays a confirmation message.
4. Tap Yes to save the changes, and then tap OK to close the dialog box.

Removing Users

Only a user assigned the Add/Manage Users privilege can remove users. Removing a user from the software does not remove the user from other systems or databases. The user still exists on your network, or in the Windows local user list.

To remove a user

1. Tap the Add/Manage Users tab to open the User Management window.
2. In the Current Users pane, select the user and tap Remove.
   QX ONE Software displays a confirmation message.
3. Tap Yes to remove the user, and then tap OK to close the dialog box.
Appendix D System Utilities

From the System Utilities tab, you can access the following tabs for managing tasks and data related to the instrument, software, data, and storage:

- **System Settings** — View shared template and data file locations
- **Event Log** — View logged data about all software activities
- **Maintenance Log** — Record maintenance activities
- **Maintenance Reports** — PDF maintenance records from Bio-Rad maintenance
- **Archive Data** — Clear up space in your primary storage areas

**Notes:**

- The Instrument Calibration tab is enabled only for the Bio-Rad service engineer user account.
- If you are not using the instrument touch screen, only the System Settings and Event Log tabs are available.

**System Settings Tab**

The System Settings window opens by default when you select the System Utilities tab, and contains fields where you can enable and enter storage file paths.

In System Settings, you can set up the following storage areas:

- Preferred Location
- Shared Settings

**Important:** Primary storage locations are either the file paths specified in the user's individual preferences, or the file paths specified under Preferred Locations. If a system administrator enables the Preferred Location settings for all users, files paths in individual user preferences are overridden.
Preferred Location

If Preferred Location file paths are used, then data files for all users are automatically saved to the specified folders on the instrument.

**Important:** Only users assigned the System Settings user privilege can set preferred locations. This setting overrides individual user storage settings.

**Note:** Preferred location restrictions apply to data files only; users are able to choose a location for template storage.

**To specify preferred locations**

1. Select the Use for all users checkbox and tap Save.
   
   The file paths are identified in the Datafile Storage Location and Template Storage Location fields.

2. (Optional) Modify the file paths, and then tap Save.

**Shared Settings**

Under Shared Settings, you can specify two shared data file storage folders and one shared template storage folder. Because data files are often very large, the software allows you to set a primary storage folder and a backup storage folder. Bio-Rad recommends routinely checking available storage space and if necessary, using the Archive function.
Important: Only users assigned the System Settings user privilege can change storage locations in the System Settings window.

To specify shared folders

1. In the Datafile Storage Location field, enter a file path or tap Browse to search for the folder.
2. In the Datafile Storage Location 2 folder, enter a file path or tap Browse to search for the folder.

   Note: These paths point to secondary storage locations. Data files are always saved initially to the preferred location (if specified by your administrator), or to the path specified in the user’s preferences.

3. In the Template Storage Location field, enter a file path or tap Browse to search for the folder.
4. Tap Save.

System Log Files

From the System Utilities tab, you can access log files for system and software events (event log), and maintenance activities (maintenance log).

Event Log

Users who are assigned the Maintenance user privilege can view the system event log, which contains timestamped information on all software activities.
To view the Event Log

1. Select the System Settings tab.
2. Select Event Log and do one of the following:
   - Scroll through the list of events displayed in the Event Log window.
   - Tap Open Log and open the text file in Notepad.

3. (Optional) To automatically generate and display a PDF document, tap PDF Report.
   
   **Tip:** To restrict access to the file, you can assign a password. Select the PDF Password check box and then enter a password in the field. The file is saved in the Log Reports folder and can be opened only by entering the password.

**Maintenance Log**

All users can view the maintenance log, which contains a list of maintenance records. The Maintenance Log tab is available from the instrument touch screen only.

Users who are assigned the Maintenance user privilege can set up maintenance records, specify associated activities, and generate PDF reports.
To view the Maintenance Log

1. Select the System Settings tab.
2. Select Maintenance Log.
3. To view the log entries, scroll through the list in the grid.

To add a new activity

1. Tap the plus sign (+) next to New Activity.

   A line item appears in the grid and the Date Time, User, Product Version, and Firmware Version fields are automatically completed.

2. In the Activity field, enter a description of the planned activity.
3. Tap Save.
4. Repeat to add another activity.
   After saving, you can create a PDF report of the added activities.
5. (Optional) Tap PDF Report.

Maintenance Reports

Reports generated from the Bio-Rad service engineer when performing maintenance on your instrument are stored on the Maintenance Reports tab. The Maintenance Reports tab is available from the instrument touch screen only.

- To open a report, tap the list item.
Following is an example of a Color Calibration report:

Archiving Data

When the storage space on the touch screen computer installed on the QX ONE Droplet Digital PCR System approaches a predefined limit, the software displays an advisory message at set intervals. Users can free up space by moving raw data to an archive storage folder in a different location. The Data Archive tab is available from the touch screen only.

Important: You must be assigned the Data Archive user privilege to archive data.
To archive files

1. Select the System Settings tab.

2. Select Archive Data.

   You can archive raw data only.

3. Under Raw Data Archive Progress, tap the calendar icons and select a From date and a To date to define a date span.

4. Tap Browse to search for a select the target storage location.

5. Tap Archive.

System Calibration

You cannot execute runs on the QX ONE Droplet Digital PCR System unless the instrument is properly calibrated.

Only a Bio-Rad service engineer can calibrate your instrument and use the Instrument Calibration options in QX ONE Software. The option is available from the touch screen only, and is disabled for all other users.

If your instrument requires service, contact Bio-Rad Technical Support.
