

CERTIFICATION

AOAC Research Institute Performance Tested MethodsSM

Certificate No. **031209**

The AOAC Research Institute hereby certifies the method known as:

iQ-Check Campylobacter Real-Time PCR

Corporate Location Bio-Rad Laboratories 2000 Alfred Nobel Drive Hercules, CA 94547 USA Manufacturing Location Bio-Rad Laboratories 925 Alfred Nobel Drive Hercules, CA 94547 USA

This method has been evaluated in the AOAC Research Institute *Performance Tested Methods*SM Program and found to perform as stated in the applicability of the method. This certificate indicates an AOAC Research Institute Certification Mark License Agreement has been executed which authorizes the manufacturer to display the AOAC Research Institute *Performance Tested Methods*SM certification mark on the above-mentioned method for the period below. Renewal may be granted by the Expiration Date under the rules stated in the licensing agreement.

December 2023 Level 3	 SUMMARY OF MODIFICATION Software update. Software update and manual edits. Editorial/clerical changes. Software was updated from Version 3 to Version 4 allowing compatibility with Windows 10. Editorial changes and addition of user information in French, German, Spanish, Portuguese, and Italian. Addition of CFX Opus Deepwell, with CFX Manager Software, Industrial Diagnostic Edition version 3.1 using Free DNA Removal Solution and Fast APF protocols. Editorial/clerical changes. Matrix extension to include raw ground chicken (325 g), chicken carcass rinse (30 mL) and turkey carcass sponges using Hunt broth. Also, RAPID'<i>Campylobacter</i> agar was approved as an alternative agar for confirmation of presumptive iQ-Check positive test portions.

Bio-Rad iQ-Check Campylobacter Real-Time PCR, AOAC Performance Tested MethodsSM certification number 031209

PRINCIPLE OF THE METHOD (1)

The iQ-Check *Campylobacter* kit is a rapid method test kit based on gene amplification and detection by real-time polymerase chain reaction, (RTi-PCR). Ready-to-use RTi-PCR reagents contain DNA primers and a DNA probe specific for *C. jejuni, C. coli* and *C. lari,* as well as DNA polymerase and nucleotides. PCR is a technique used to generate many copies of target DNA. During the PCR reaction, several cycles of heating and cooling performed by a thermal cycler instrument allow DNA denaturation, by heat, followed by primers binding to the target region. The DNA polymerase then uses these primers and deoxynucleotide triphosphates (dNTPs) to extend the DNA, creating copies of the target DNA. These copies, called amplicons, are detected during the amplification by hybridizing specific patented double stranded oligonucleotide fluorescent probes. These probes are linked to a fluorophore which fluoresces only when hybridized to the target sequence. In the iQ-Check *Campylobacter* kit, carboxyfluorescein (FAM) is the fluorophore linked to the probe hybridizing to the *Campylobacter* specific DNA sequence. In the absence of target DNA, no fluorescence will be detected, and the sample determined to be negative. As the amount of amplicons increases with each round of amplification, fluorescence intensity also increases. During each PCR cycle, at the annealing step, the real-time PCR instrument measures this fluorescence and the associated software plots the fluorescence intensity versus number of cycles. This method allows a simple determination of the presence of *Campylobacter* in a sample. To monitor for a successful DNA amplification in each reaction tube, a synthetic DNA "internal control" is included in the reaction mix. This control is amplified with a specific probe at the same time as the *Campylobacter* target DNA sequence and detected by a second fluorophore. The iQ-Check *Campylobacter* kit has been validated on the Bio-Rad thermal cyclers listed below.

DISCUSSION OF THE VALIDATION STUDY (1)

The iQ-Check *Campylobacter* kit can be used after a single 24 h primary enrichment. The culture method requires a 48 h enrichment followed by another 48 h on a selective agar plate. The culture method relies on the target bacteria's ability to grow on a plate, which can be suppressed by the cells being stressed, being out-competed for nutrients by background flora or by improper modified atmospheric conditions. The iQ-Check *Campylobacter* kit uses primers and specific DNA hybridization probes targeting a specific sequence on the *Campylobacter* genome. Detecting target DNA is possible even if the cells are stressed or in lower numbers. Previous studies have demonstrated the sensitivity of PCR methods used in the food safety industry (2). This increased sensitivity and time saving provide users with an alternative to the reference method for detection of *Campylobacter* in food samples.

Bio-Rad iQ-Check Campylobacter Real-Time PCR, AOAC Performance Tested MethodsSM certification number 031209

DISCUSSION OF THE MODIFICATION STUDY APPROVED JANUARY 2023 (4)

The new CFX Opus Deepwell instrument delivers the same performance as the current CFX96 Touch Deep Well instrument but with a more modern design and cloud capabilities. The improved stability of the thermal block ensures a more uniform thermal protocol. The CFX Manager Software, IDE v 3.1 brings the same performance, algorithm, and interpretation as the current CFX Manager Software, IDE v 3.0 with the only change being compatibility to both CFX96 Touch Deep Well and CFX Opus Deepwell instruments.

DISCUSSION OF THE MODIFICATION STUDY APPROVED DECEMBER 2023 (5)

The iQ-Check *Campylobacter* Method successfully detected *Campylobacter* spp. in raw ground chicken, chicken carcass rinsate, and turkey carcass sponge using Hunt broth. After POD analysis, no statistical differences were detected between the number of positive iQ-Check results and the reference methods for all test portions tested. There were no differences in the confirmed results when using RAPID'*Campylobacter* as an alternative confirmation agar to Campy-Cefex agar. The iQ-Check *Campylobacter* Method and RAPID'*Campylobacter* agar as an alternative confirmation agar are easy to use. All test results are easily interpreted, and for iQ-Check *Campylobacter* results are displayed automatically at the end of the run without manipulation by the end user.

^aMPN = Most Probable Number is calculated using the LCF MPN calculator ver. 2.0 provided by AOAC RI, with 95% confidence interval

^bN = Number of test portions

^cx = Number of positive test portions

^dPOD_c = Candidate method confirmed positive outcomes divided by the total number of trials

^ePOD_R = Reference method confirmed positive outcomes divided by the total number of trials

^fIdentical results between Campy-Cefex agar and RAPID'Campylobacter agar

gdPODc= Difference between the confirmed candidate method result and reference method confirmed result POD values

^h95% CI = If the confidence interval of a dPOD does not contain zero, then the difference is statistically significant at the 5% level

ⁱATCC = American Type Culture collection, Manassas, VA
